Attention: Mr. David Kinard, PE

Reference: Asbestos & Lead-Based Paint Assessment Carolina Crossroads I-20/26/126 Project I-26 Westbound Ramp to Bush River Road Structure No. 401002640372 Columbia, Richland County, South Carolina S&ME Project No. 1461-16-047

Dear Mr. Kinard:

S&ME, Inc. (S&ME) is pleased to provide the enclosed report detailing our Asbestos and Lead-Based Paint Assessment of the I-26 Westbound Ramp over I-126 to Bush River Road in Columbia, Richland County, South Carolina (Structure No. 401002640372). Our services consisted of an asbestos assessment and lead-based paint assessment. The work was performed in accordance with our subcontract modification dated January 24, 2018 to our Subconsultant Agreement dated August 17, 2016. The enclosed report includes the executive summary, project background, investigative procedures, findings and results, and conclusions and recommendations as necessary.

This report is provided for the use of the HDR Engineering Inc., of the Carolinas and South Carolina Department of Transportation. Use of this report by any other parties will be at such party's sole risk and S&ME, Inc. disclaims liability for any such use or reliance by third parties. The results presented in this report are indicative of conditions only during the time of the assessment.

In accordance with South Carolina Department of Health and Environmental Control Regulation 61-86.1 Standards of Performance for Asbestos Projects, this asbestos assessment report will remain valid for three years from the date of inspection (February 2021).

Carolina Crossroads I-20/26/126 Project I-26 Westbound Ramp to Bush River Road Columbia, Richland County, South Carolina S&ME Project No. 1461-16-047

We appreciate the opportunity to provide you with our industrial hygiene/environmental services. If you have any questions concerning this report, please call us at (803) 561-9024.

Sincerely,

S&ME, Inc.

e de la compañía de l Bu

Bobby McAllister Asbestos Building Inspector (SCDHEC License No. BI-01429)

kan 1

Tom Behnke, P.G., CHMM Project Manager/Senior Reviewer (SCDHEC License No. MP-00004)

## **Executive Summary**

An asbestos assessment and lead-based paint assessment was conducted on February 20 & 21, 2018 of the I-26 Westbound Ramp over I-126 to Bush River Road (Structure No. 401002640372) in Columbia, Richland County, South Carolina. The purpose of the assessment was to identify asbestos-containing materials (ACMs) and lead-based paint coatings associated with the structure prior to renovation or demolition activities.

The bridge consists of a two-lane asphalt roadway with concrete curbing resting on concrete beams with a concrete deck on the east side and concrete beams with a metal deck on the west side supported by concrete piers

#### Asbestos

The asbestos assessment was performed in general accordance with the South Carolina Department of Health and Environmental Control (SCDHEC) Regulation 61-86.1, *Standards of Performance for Asbestos Projects* effective May 27, 2011. The asbestos assessment included the bulk sampling and analysis of suspect ACMs from the structure. The suspect materials identified on the bridge structure included vibration dampener, expansion joint, tar material and texture coating.

The Environmental Protection Agency (EPA) and SCDHEC define materials as asbestos-containing if an asbestos content of greater than one percent (>1%) is detected in a representative sample. Asbestos, in concentrations >1%, was **not** identified as a result of the assessment.

#### Lead-Based Paint

Painted surfaces associated with the bridge structure were considered suspect and analyzed for lead content. Painted surfaces exceeding the SCDHEC disposal criteria of 0.7 milligrams per square centimeter (mg/cm<sup>2</sup>) were considered lead-based paint for the purpose of this assessment. The following is a summary of the identified lead-based paint systems:

• Gray foot plate located underneath bridge on the east side (23.9 mg/cm2)

# 1.0 Introduction

S&ME was contracted to perform an asbestos and lead-based paint assessment of the I-26 Westbound Ramp over I-126 to Bush River Road in Columbia, Richland County, South Carolina. The site location and structure are identified on **Exhibits 1-2** in **Appendix II**. The bridge is identified as structure number 401002640372. These services were requested and authorized by the South Carolina Department of Transportation (SCDOT). We understand the bridge is scheduled for renovation and/or demolition activities. The asbestos and lead-based paint assessment was performed on February 20 & 21, 2018.

The bridge overpass consists of a two-lane asphalt roadway with concrete curbing resting on concrete beams with a concrete deck on the east side and concrete beams with a metal deck on the west side supported by concrete piers. The bridge is approximately 360 feet long and 40 feet wide. Photographs of the structure are provided in **Appendix II**.

#### Asbestos Assessment

The asbestos assessment was performed to identify and sample suspect ACMs in accordance with regulatory requirements for structures scheduled to be renovated or demolished. Demolition and renovation activities are regulated by OSHA, EPA and SCDHEC. The EPA and SCDHEC require asbestos assessments, conducted by licensed individuals, prior to renovation and/or demolition projects. Code 40 of Federal Regulations Part 61-86.1 require asbestos assessments, followed by the proper removal, and disposal of ACM that is affected by renovation or demolition. The identification of ACMs will aid in the prevention of occupational exposures and/or environmental releases of airborne asbestos. Identification of ACM is also required by OSHA 1926.1101. The EPA, OSHA and SCDHEC define ACM as materials containing greater than one (1) percent asbestos in a representative sample. However, OSHA regulates materials containing less than or equal to one percent asbestos. Identification of ACMs also complies with Title 40 Code of the Federal Regulations, part 61, and State Regulation 61-86.1 enforced by the SCDHEC, along with Title 29 Code of Federal Regulations, part 1926 enforced by OSHA.

Section 2.0 describes the assessment procedures used, results of the suspect ACMs sampled and analyzed, confirmed ACMs located on the structure, and conclusions and recommendations regarding the subject bridge as related to ACMs.

#### Lead-Based Paint Assessment

The purpose of the lead-based paint assessment was to identify observable lead-based paint finishes associated with the structure which may be adversely affected by future renovation or demolition activities. The identification of these materials will aid in the compliance of occupational exposure (OSHA) and/or environmental releases of airborne lead dust in accordance with 29 CFR 1926.62 (Lead in Construction) and provide information to facilitate proper disposal of lead-based paint coated components and debris in accordance with the SCDHEC and EPA.

# 2.0 Asbestos Assessment

#### 2.1 Assessment Procedures

The asbestos assessment was performed by observing and collecting random samples of suspect asbestoscontaining materials associated with the subject bridge structure. Significant destructive investigative techniques and sampling was not performed as part of this assessment. Consequently, the possibility exists that suspect materials were not detected in inaccessible areas such as pipe chases, voids, or in areas deemed unsafe to enter by the asbestos inspector. If additional suspect materials are discovered during future renovation or demolition activities, destructive actions to the suspect ACM should not proceed until bulk samples are collected and analyzed for asbestos content.

Suspect ACMs that were observed and sampled consist of vibration dampener, expansion joint, textured coating and a black tar material.

To comply with current SCDHEC Regulations, a sampling strategy was developed to provide representative samples of suspect asbestos-containing materials in accordance with OSHA, SCDHEC and EPA. Bulk samples were then extracted from suspect ACMs and recorded on a chain of custody record and submitted to EMSL's asbestos laboratory in Pineville, North Carolina for analysis via the following method:

#### Polarized Light Microscopy (PLM)

The suspect materials were analyzed by trained microscopists using PLM techniques coupled with dispersion staining in accordance with EPA Test Method Title 40 Code of Federal Regulations, Chapter I (1-1-87 edition), Part 763, Subpart F-APPENDIX A. This method identifies asbestos mineral fibers based on six optical characteristics: morphology, birefringence, refractive index, extinction angle, sign of elongation and dispersion staining colors. The laboratory analysis reports the specific type of asbestos identified (there are six asbestos minerals) and the percentage of asbestos presents.

#### Transmission Electron Microscopy (TEM)

In accordance with SCDHEC Regulation 61-86.1, Transmission Electron Microscopy (TEM) confirmation analysis is required to be performed on one sample of any non-friable organically bound material (NOB) that tests negative via PLM analysis. The TEM analysis was performed by EMSL using EPA 600 Method in accordance with ASTM E2356.

Both the PLM and the TEM laboratories are accredited by the National Voluntary Laboratory Accreditation Program (NVLAP), which is administered by the National Institute of Standards and Technology.

#### 2.2 Findings and Results

The asbestos assessment conducted on February 20 & 21, 2018 included the quantification and random bulk sampling of various suspect asbestos-containing materials associated with the bridge structure. The suspect materials consisted of vibration dampener, expansion joint and black tar material. No suspect drainage scuppers were observed on the structure. The EPA and SCDHEC define materials as asbestos-containing if an asbestos content >1% is detected in a representative sample. In accordance with SCDHEC Regulation 61-86.1, TEM analysis

was performed on one sample of each of the following non-friable, organically-bound (NOB) materials from the bridge that displayed a result of no asbestos detected via PLM analysis:

- Vibration dampener
- Asphalt material
- Tar material

Of the representative materials sampled and analyzed during this assessment, asbestos in concentrations >1% was **not** identified.

A table summarizing the sample number, location, type of material tested, approximate quantity of the material sampled, condition of the material, and corresponding result for each sample is provided in **Appendix I**. Site Exhibits and photographs are provided in **Appendix II**. A copy of the inspector's SCDHEC license is provided in **Appendix V**.

# 3.0 Lead-Based Paint Assessment

#### 3.1 Assessment Procedures

The lead-based paint assessment was conducted for compliance with the SCDHEC limit of 0.7 milligrams of lead per square centimeter (mg/cm<sup>2</sup>) of painted surface for lead-based paint coated waste. SCDHEC, Health Division defines lead-based paint as a coating containing lead in quantities  $\geq$  0.7 mg/cm<sup>2</sup> (SCDHEC, Health Division definition #4-53-1320f). Any coated surfaces meeting or exceeding the SCDHEC limit of 0.7 mg/cm<sup>2</sup> were considered lead-based paint for the purpose of this assessment.

OSHA does not recognize a threshold level of lead for definition purposes, only the presence or absence of lead. The current OSHA regulations recognize an airborne action level of thirty micrograms of lead per cubic meter of air (30  $\mu$ g/m<sup>3</sup>) during an eight-hour day and a permissible exposure level of fifty micrograms per cubic meter (50  $\mu$ g/m<sup>3</sup>).

Representative covered components and surfaces were analyzed utilizing a Niton XLp-300A X-Ray Fluorescence (XRF) spectrum analyzer (serial #95004). The suspect painted finishes were selected based on the color of the topcoat and the underlying paint layers and/or the substrate on which it was applied.

#### 3.2 Findings and Results

Coated surfaces associated with the bridge structure were tested for the presence of lead-based paint. The coated surfaces meeting or exceeding the SCDHEC limit of 0.7 mg/cm<sup>2</sup> were considered lead-based paint for the purpose of this survey. The following is a summary of the identified lead-based paint systems:

• Gray foot plate located underneath bridge on the east side (23.9 mg/cm<sup>2</sup>)

The XRF summary with sample numbers, sample location, component, substrate, paint color, condition, and results are provided in **Appendix IV**.

The XRF summary with sample numbers, sample location, component, substrate, paint color, condition, and results are provided in **Appendix IV**.

# 4.0 **Conclusions and Recommendations**

Based on the findings of this assessment, we provide the following conclusions and recommendations:

#### 4.1 Asbestos

No asbestos containing materials were identified on the structure. If additional suspect materials are discovered during future renovation or demolition activities, destructive actions to the suspect ACM should not proceed until bulk samples are collected and analyzed for asbestos content.

#### 4.2 Lead-Based Paint

The gray foot plate located underneath bridge on the east side (23.9 mg/cm<sup>2</sup>) exceeded the SCDHEC 0.7 mg/cm<sup>2</sup> limit for lead-based paint. Refer to **Appendix II** for photographs of the identified lead-based paint systems.

The client is advised that OSHA does not recognize a threshold level of lead for definition purposes, only the presence or absence of lead. Consequently, the OSHA regulations governing worker protection for lead-based paint may apply to work practices including the disturbance of paint systems with detectable levels of lead. Destructive actions (sanding, burning, demolition, component removal, paint preparation) to the lead-containing paint surfaces will require the contractor comply with the standards of OSHA, including but not limited to initial exposure monitoring, the use of personal protective equipment, and medical surveillance.

SCDHEC Regulation 61-107.19 permits demolition materials painted with lead-based paint ( $\geq$  0.7 mg/cm<sup>2</sup>) to be disposed in a permitted Class Two (C&D) or Class Three Subtitle D, Municipal Solid Waste (MSW) landfill.

Accumulations of paint waste (chips, dust, or flakes) must be tested by the Toxicity Characteristic Leaching Procedure (TCLP) to determine if the waste is classified as hazardous, which requires disposal in a Subtitle C (hazardous waste) landfill. Lead waste, at a minimum, must be disposed in a Class Two or Three landfill.

# 5.0 Limitations

This report is provided for the sole use of the Client. Use of this report by any other parties will be at such party's sole risk, and S&ME disclaims liability for any such use or reliance by third parties. The results presented in this report are indicative of conditions only during the time of the sampling period and of the specific areas referenced. Under no circumstances is this report to be used as a bidding document, or as a project design or specification.

#### **Carolina Crossroads I-20/26/126 Project I-26 Westbound Ramp to Bush River Road** Columbia, Richland County, South Carolina S&ME Project No. 1461-16-047

S&ME performed the services in accordance with generally accepted practices of reputable environmental consultants undertaking similar studies at the same time and in the same geographical area. S&ME has endeavored to meet this standard of care. No other warranty, expressed or implied, is intended or made with respect to this report or S&ME's services. Users of this report should consider the scope and limitations related to these services when developing opinions as to risks associated with the site. Additional limitations to our survey are as follows:

• Significant destructive sampling was not performed during the asbestos survey. Additional suspect ACMs may be present in inaccessible locations such as materials encased in concrete. Consequently, if additional suspect materials are discovered during future renovation or demolition activities, bulk samples must be collected and analyzed for asbestos content.
