

August 25, 2015

Mr. Greg Schuch, P.E.  
Design Manager  
501 Huger Street  
Columbia, South Carolina 29201

Dear Mr. Schuch,

We have completed the Geotechnical Base Line Report associated with the Interstate 20 roadway improvements in Lexington County, South Carolina. Please call at your convenience if you have questions or comments. HDR|ICA appreciates the opportunity to provide geotechnical engineering services to the South Carolina Department of Transportation.

Sincerely,  
HDR|ICA

Kenneth R. Bussey, Jr., P.E.  
Geotechnical Engineer

Brian Edwards, E.I.T.

# Geotechnical Base Line Report

I-20 Widening Design-Build Preparation

*Lexington County, South Carolina*

# 1 Project Information

This Geotechnical Base Line Report (GBLR) provides a characterization of subsurface conditions and preliminary geotechnical information to the design team for the I-20 roadway improvements in Lexington County, South Carolina. The geotechnical data presented herein includes standard penetration testing, bulk samples, Shelby tube sampling, a Multichannel Analysis of Surface Waves (MASW) survey, and laboratory testing results. The subsurface information provides correlation with regional geological stratigraphy and site specific strata conditions to aid the South Carolina Department of Transportation (SCDOT) with information pertaining to future design-build letting process. A site vicinity map is included in Appendix A.

## 2 General Project Information

The SCDOT proposes to widen I-20 from near mile point 60.2 (West of US-378) on the eastern terminus to approximately mile point 49 (West of Longs Pond Road) on the western terminus. The project includes adding a travel lane in each direction, improving various exit ramps, adding a noise wall structure, and replacing or widening the parallel mainline bridges over Norfolk Southern Railroad and Meat Plant (Frontage) Road near mile point 57.

This report presents the results of the subsurface exploration program along I-20 and summarizes the laboratory testing program to provide geotechnical baseline data to be utilized for the preliminary design and estimating as part of a future design-build letting process.

This report presents a general discussion of preliminary design and construction issues anticipated for the proposed roadway widening and bridge construction. As of completing this report, the subsurface and laboratory information pertaining to the noise wall have not been finalized and will be submitted as an addendum at a later date.

### 2.1 Regional Geology

The proposed preliminary boring alignment passes over undifferentiated Cretaceous sands and kaolin clays progressing from southwest to northeast. The sands are typically poorly to well sorted, micaceous, subangular, fine grain to gravelly and contain variable fractions of silt and clay. Thin accumulations of angular to subangular quartz sand, tentatively identified as Pinehurst Formation, may be encountered at the SC6/South Lake Drive interchange. Upland elevations near the southeastern end of the alignment are reported to be underlain by fine to coarse sands and thinly interbedded kaolin clays of the Tertiary Huber Formation and fine to coarse grain sands of the Tertiary Barnwell Group. Isolated exposures of Quaternary-Tertiary quartz sands are indicated within the northeastern half of the proposed alignment. Undifferentiated Paleozoic crystalline rock composed of metamorphosed, foliated volcanic deposits and/or granite and exhibiting vertical to steeply dipping to the southeast foliation may be encountered from the Augusta Road (US 1) interchange northeastward to the end of proposed alignment. The

crystalline rock is overlain by relatively thin residual silts and clays with interlayered fine to medium grain sands. Alluvium composed of sands and clays may be anticipated within creek floodplain crossings. Roadway embankment materials may be anticipated at bridge approaches.

## 2.2 Site Geology

Geotechnical borings advanced within the limits of the proposed widening alignment recovered samples suggesting two distinct soil profiles extending from the beginning of the project to immediately north of the US 1 and I-20 interchange and from that position to the end of the project.

Recovered soils from US 1/I-20 northeastward were primarily composed of silt and clay with some fine grain sand exhibiting low to medium plasticity characteristics. Consistency ranged from very soft to hard. Interlayered silty to occasionally clayey, fine to medium grain sand was also encountered. These sands exhibited non-plastic, low plasticity, and medium plasticity characteristics based upon laboratory testing and loose to very dense compaction resulting from SPT (standard penetration test) drives. Collectively, these soils are interpreted as residual in origin. Advanced borings penetrated 26.8 feet to 30.1 feet without auger refusal interception. Refusal during SPT sampling was intercepted within borings B-1, B-4, and B-5. Borings B-6A, B-6B, and B-7A were advanced to collect bulk samples and Shelby tube samples. Published mapping suggests rock underlying these soils is crystalline, felsic to mafic, metamorphosed volcanic tuff, mudstones, and quartzite of the Carolina Slate Group (Paleozoic) with the potential for intrusive bodies of Columbia metagranite.

Recovered soils from US 1/I-20 southwestward were primarily composed of fine and medium grain sand with secondary fractions of silt, clay, and coarse grain sand. Sands were typically subangular, non-reactive, weakly cemented, and poorly to well graded. Compaction, determined by SPT drives, varied from loose to dense. Interbedded low to medium plasticity clay and silt with secondary fractions of fine grain sand and traces of gravel (cemented fragments) were also encountered. Consistency varied from soft to hard based upon SPT drives. Collectively, these soils are interpreted as residual in origin. Advanced borings penetrated 29.7 feet to 30.6 feet without auger or SPT refusal. Borings B-15A, B-27A, and B-27B were advanced to collect bulk samples and Shelby tube samples. Published mapping suggests rock underlying these soils is crystalline, felsic to mafic, metamorphosed volcanic tuff, mudstones, and quartzite of the Carolina Slate Group (Paleozoic) with the potential for intrusive bodies of Columbia metagranite.

Recovered soils from preliminary bridge borings at I-20 over the railroad and Meat Plant (Frontage) Road were primarily composed of clayey, medium plasticity, fine and medium grain sand, and non-plastic fine to medium grain sand with silt interpreted as roadway embankment fill. Compaction, determined by SPT drives, varied from very loose to medium dense. Residual soils, underlying the fill, were composed primarily of clayey, medium plasticity, fine and medium grain sand, non-plastic fine to medium grain sand with silt, non-plastic fine and medium grain sand with varying silt fractions and medium grain sand with clay exhibiting medium to high plasticity. Compaction varied from very loose to dense. Interbedded low plasticity, finely sandy silt and medium to high plasticity clay with fine grain sand were also encountered within the advanced preliminary bridge

borings. Consistency varied from stiff to hard based upon SPT drives. Advanced borings penetrated 99.3 feet and 99.7 feet, respectively, without auger refusal prior to termination. Refusal was encountered during SPT sampling within boring B-31 leading to boring termination. Published mapping suggests rock underlying these soils is crystalline, felsic to mafic, metamorphosed volcanic tuff, mudstones, and quartzite of the Carolina Slate Group (Paleozoic) with the potential for intrusive bodies of Columbia metagranite.

Bridge boring B-31 encountered an interval producing flowing water from 60.5 feet to 64.0 feet (elevation range 341.9–338.4). Review of the recovered samples at 59.0' -60.5' and 64.0'-65.5' and discussions with the driller suggest the actual water bearing strata may be thin sand seams rather than the entire 3.5 foot thick interval. Water flow to the surface, upon initial penetration produced flow over the top of a two (2) foot casing stickup. This flow during drilling operations was minimized and ultimately stopped by 1) the introduction of barite drilling mud replacing the potable water/native cuttings initially used and 2) time for the water flow to out pace recharge. The thickened and more dense (per gallon) fluid and time successfully diminished then contained water flow from the subject strata interval overnight enabling completion of the boring and immediate backfill due to boring location along the roadside. A similar interval was not encountered within bridge boring B-32 as indicated on the interpreted subsurface bridge profile in Appendix A. The lack of recovery within sample interval 69.0'-70.5', boring B-31, is interpreted to be unrelated to the water bearing seams rather a mechanical issue with the sampling rods. For roadway borings static (24 hour) water level measurements throughout the proposed widening alignment varied from elevation 415.6 to elevation 256.9.

## 3 Field Exploration Program

HDR | ICA conducted a preliminary geotechnical subsurface site exploration in January and February 2015. The subsurface investigation consisted of forty (40) SPT borings, four (4) Shelby tube sample borings and two (2) bag sample borings. Two (2) borings (B-31 and B-32) were performed at the proposed bridge site. Termination depths for the borings ranged from 26.3 feet to 99.7 feet below the ground surface. Borings were advanced by CME-55 and CME-45C track-mounted drill rigs using rotary wash and 3½" hollow-stem auger techniques. In addition, a shear wave velocity measurement (MASW-1) was obtained by Terracon near the bridge location using Multi-channel Analysis of Surface Waves (MASW) methods.

A boring location plan showing the preliminary test boring locations is located in Appendix A. Boring logs and the MASW profiles from the preliminary investigation are included in Appendix B. The test locations and pertinent information are summarized below in Table 3-1 below.

**Table 3-1. Subsurface Testing Locations**

### 3.1 Standard Penetration Testing

In the preliminary borings, SPTs were typically conducted at 2-foot intervals in the top 10 feet of each boring and at 5-foot intervals thereafter until termination depth. It should be noted that the N-values presented on the boring logs are the uncorrected, field N-values. Blow counts recorded at these intervals were produced from SPT hammers with energy ratios of 90% for the CME-55 and 90.1% for the CME-45C. The hammer energy ratio is identified on each boring log and the hammer reports are included in Appendix E.

### 3.2 MASW Survey

Multi-channel Analysis of Surface Waves (MASW) is a seismic method that uses the dispersive characteristics of Rayleigh-type surface waves to determine the variation of the shear wave velocity of layered systems with depth. Unlike spectral analysis of surface waves (SASW) which can get overwhelmed by noise and other artificial source waves, the MASW method can identify and reject non-fundamental Rayleigh waves and noise; thereby, it can focus the data collection on the Rayleigh waves. Refraction Microtremor (ReMi) and Microtremor Array Measurement (MAM) are two methods of

passive source techniques to measure noise. In both, lower frequency surface waves arising from microtremors and/or noise, such as traffic, are recorded using linear or two dimensional arrays of geophones. Due to the shortcomings of techniques being performed alone and the advantages offered through their combined use, Terracon used MAM in conjunction with MASW for the development of this survey.

The one (1) MASW, MASW-1, was performed at the southern embankment near the proposed bridge structure. Since the test was performed through roughly 30 feet of existing fill material, the calculation for the shear wave velocity only considered the depth interval from 30 feet to 130 feet in order to neglect the shear wave measurements within the fill. The result of the survey is an average shear wave velocity of 1,511 feet per second (ft/sec) in the 100 feet of residual soil below the existing embankment.

Therefore, based on this result, we would recommend that the site would classify as Site Class C in accordance with Table 12-22 in the SCDOT Geotechnical Design Manual (GDM). The result of the MASW test is shown Appendix B and the location of MASW-1 can be found on the test location plans in Appendix B.

## 4 Laboratory Testing Program

Laboratory tests performed on representative samples were selected by SCDOT. Procedures included natural moisture content of soils, Atterberg limits, sieve analysis, AASHTO and ASTM soil classification, standard proctor, corrosion series testing, organic content testing, consolidation testing, unconfined compressive (UC) triaxial testing, unconsolidated undrained (UU) triaxial testing, consolidated-undrained (CU) triaxial testing, and direct shear testing. Table 4-1 summarizes the testing performed and quantity of each test. Laboratory results are presented in Appendix C.

**Table 4-1. Laboratory Testing Summary**

Test Type	Quantity
Natural Moisture Content	109
Atterberg Limits	102
Sieve Analysis/Soil Classification	113
Standard Proctor	4
Corrosion Series	4
Organic Content	1
Consolidation	2
UC Triaxial	4
UU Triaxial	2
CU Triaxial	3
Direct Shear	1

## 5 Seismic Considerations

A MASW test was performed by Terracon near the bridge location utilizing MASW methods and is included in Appendix B. The seismic site class was based on the data obtained from the boring logs, MASW testing, and the Site Class definitions given in Table 12-22 of the SCDOT GDM. For the proposed replacement bridge, the 100 feet of residual soils below the existing embankment classify as Site Class C with a characteristic average shear velocity of 1,511 ft/sec. The proposed bridge is classified as OC I and the proposed approach embankments within 150 feet of the bridge are classified as ROC I. Roadway embankments beyond 150 feet of the bridge are classified as ROC IV, in accordance with the Bridge Design Memorandum DM0211 dated July 7, 2011.

### 5.1 Acceleration Design Response Spectrum (ADRS)

The SCDOT Design-Build Group provided pseudo spectral accelerations (PSA) for the Safety Evaluation Earthquake (SEE) (3% probability of exceedance in 75 years) and the Functional Evaluation Earthquake (FEE) (15% probability of exceedance in 75 years). Under the geologically realistic condition, these values were provided for 5% critical damping and the peak ground acceleration (PGA) at the B-C boundary. The acceleration design response spectra (ADRS) curves were provided and the seismic design parameters derived from these curves include the FEE PGA ( $\text{PGA}_{\text{FEE}}$ ), the FEE short period (0.2 second) Acceleration ( $S_{\text{DS-FEE}}$ ), the FEE one second Acceleration ( $S_{\text{D1-FEE}}$ ), the SEE PGA ( $\text{PGA}_{\text{SEE}}$ ), the SEE short period Acceleration ( $S_{\text{DS-SEE}}$ ), and the SEE one second Acceleration ( $S_{\text{D1-SEE}}$ ). The seismic design parameters are summarized in Table 5-1 and the results of the ADRS analysis are presented in Appendix D.

**Table 5-1. Seismic Design Parameters for Site Class C**

Seismic Design Parameter	Value
$\text{PGA}_{\text{FEE}}$	0.11
$S_{\text{DS-FEE}}$	0.18
$S_{\text{D1-FEE}}$	0.08
$\text{PGA}_{\text{SEE}}$	0.29
$S_{\text{DS-SEE}}$	0.47
$S_{\text{D1-SEE}}$	0.23

### 5.2 Preliminary Geotechnical Seismic Hazard Screening

Sediments penetrated by the borings suggested residual soil profiles composed of undifferentiated Cretaceous sands and kaolin clays progressing from southwest to northeast, with thin accumulations of sands tentatively identified as Pinehurst Formation, kaolin clays of the Tertiary Huber Formation, and fine to coarse grain sands of the Tertiary Barnwell Group.

Due to the bridge being classified as OC I, only the soils within 150 feet of the proposed bridge location (B-31 and B-32) were screened for SSL. Roadway alignment beyond 150 feet of the bridge is classified as ROC IV and will not be designed for the extreme limit state. Section 7 provides a more detailed explanation.

Based on the geotechnical seismic hazard screening guidelines in Chapter 13 of the SCDOT GDM, the probability of seismic induced cyclic liquefaction or cyclic softening is low. However, liquefaction susceptibility is dependent on the long term elevation of the water table. The borings at the bridge were advanced using rotary wash drilling techniques and backfilled immediately after completion; therefore, 24-hour water table measurements were not obtained.

## 6 Preliminary Bridge Foundations

According to the SCDOT GDM, the GBLR is to contain limited geotechnical information and not provide engineering interpretations or recommendations. Therefore, only a brief discussion of possible foundation types and their feasibility will be discussed in this section of the report.

### 6.1 Allowable Foundation Types

Bridge foundation types including end bearing piles, friction piles, micropiles, or drilled shafts would be allowable given the subsurface profiles in the borings advanced near the proposed bridge site (B-31 and B-32).

Advanced borings penetrated 99.3 feet and 99.7 feet, respectively, without auger refusal prior to termination. Refusal was encountered during SPT sampling within boring B-31 leading to boring termination. As discussed in Section 2.2 of this report, published mapping suggests rock underlying these soils is crystalline, felsic to mafic, metamorphosed volcanic tuff, mudstones, and quartzite of the Carolina Slate Group with the potential for intrusive bodies of Columbia metagranite. Due to this preliminary subsurface investigation not including rock coring, bedrock depths and properties cannot be estimated and must be confirmed prior to considering rock bearing foundations.

Bridge Boring B-31 encountered an interval producing flowing water from 60.5 feet to 64.0 feet (elevation range 341.9–338.4) which was identified as an artesian aquifer on the soil test boring log in Appendix B. However, a similar interval was not encountered within the other bridge boring, B-32. Refer to Section 2.2 for further discussion of drilling techniques and subsurface conditions at bridge borings. If the final bridge subsurface investigation confirms the presence of an aquifer, the feasibility and constructability of drilled shafts will need to be thoroughly evaluated.

### 6.2 Corrosion and Deterioration Protection

The purpose of corrosion and deterioration testing is to provide soils data for use by a structural engineer to provide any necessary protection to the piling, concrete, reinforcing steel, etc. Corrosion and deterioration protection requirements and guidelines for piling are set forth in LRFD Section 10.7.5. Site-specific laboratory testing selected were pH, resistivity, chlorides, and sulfates. HDR|ICA completed pH and resistivity testing, and

Microbac Laboratories, Inc. completed water soluble chloride and sulfate testing. The full corrosion and deterioration testing results are summarized in Table 6-1 below and are included in Appendix C.

**Table 6-1. Corrosion and Deterioration Test Summary**

Test Hole No.	Bag Number	Station	Offset	Sample Depth	Chloride (ppm)	Sulfate (ppm)	pH	Resistivity (ohm·cm)
B-6A	Bag-5	32+759	10' RT	0.3-4.5'	6.36	18.7	6.3	15,072
B-6A	Bag-6	32+759	10' RT	4.5-10.0'	18.4	154.0	5.5	33,912
B-27A	Bag-2	74+941	9' LT	5.3-7.3'	3.94	22.1	6.4	23,550
B-27A	Bag-3	74+941	9' LT	7.3-26.5'	5.24	32.2	5.7	39,564

The following soil conditions should be considered as indicative of a potential pile corrosion or deterioration situation:

- Resistivity less than 2,000 ohm-cm
- pH less than 5.5
- pH between 5.5 and 8.5 in soils with high organic content
- Sulfate concentrations greater than 1,000 ppm

Results of the corrosion and deterioration testing indicated that the site has low potential for pile deterioration based on the sulfate concentration, resistivity, pH, and the geographical location of the project site. However, interpretation of the data and corrosion protection of the bridge structural components shall be provided by the structural engineer for the project.

## 6.3 Vibration Monitoring

Given the proximity to an existing railroad which will be in operation during construction, vibration monitoring will likely be necessary during pile driving.

## 7 Preliminary Bridge Approach and Roadway Embankments

Placement of new approach embankments will be required to achieve the proposed grades for the proposed bridge construction. The proposed bridge is classified as OC I and, in accordance with SCDOT Bridge Design Memorandum DM0211, the proposed bridge approach embankments within 150 feet of the bridge are classified as ROC I. Roadway embankments beyond 150 feet of the bridge are classified as ROC IV. In accordance with the SCDOT GDM, the approach embankments shall be designed and evaluated for the SLS and EE I limit states and roadway beyond 150 feet of the bridge

will be designed for SLS using resistance factors in Chapter 9 and performance limits in Chapter 10 of the SCDOT GDM.

As of completing this report, embankment cross-sections and bridge profiles were not available; however, slope stability and settlement analyses shall be completed at critical roadway and approach embankment sections during the final design in accordance with the SCDOT GDM.

## 8 Limitations to Report

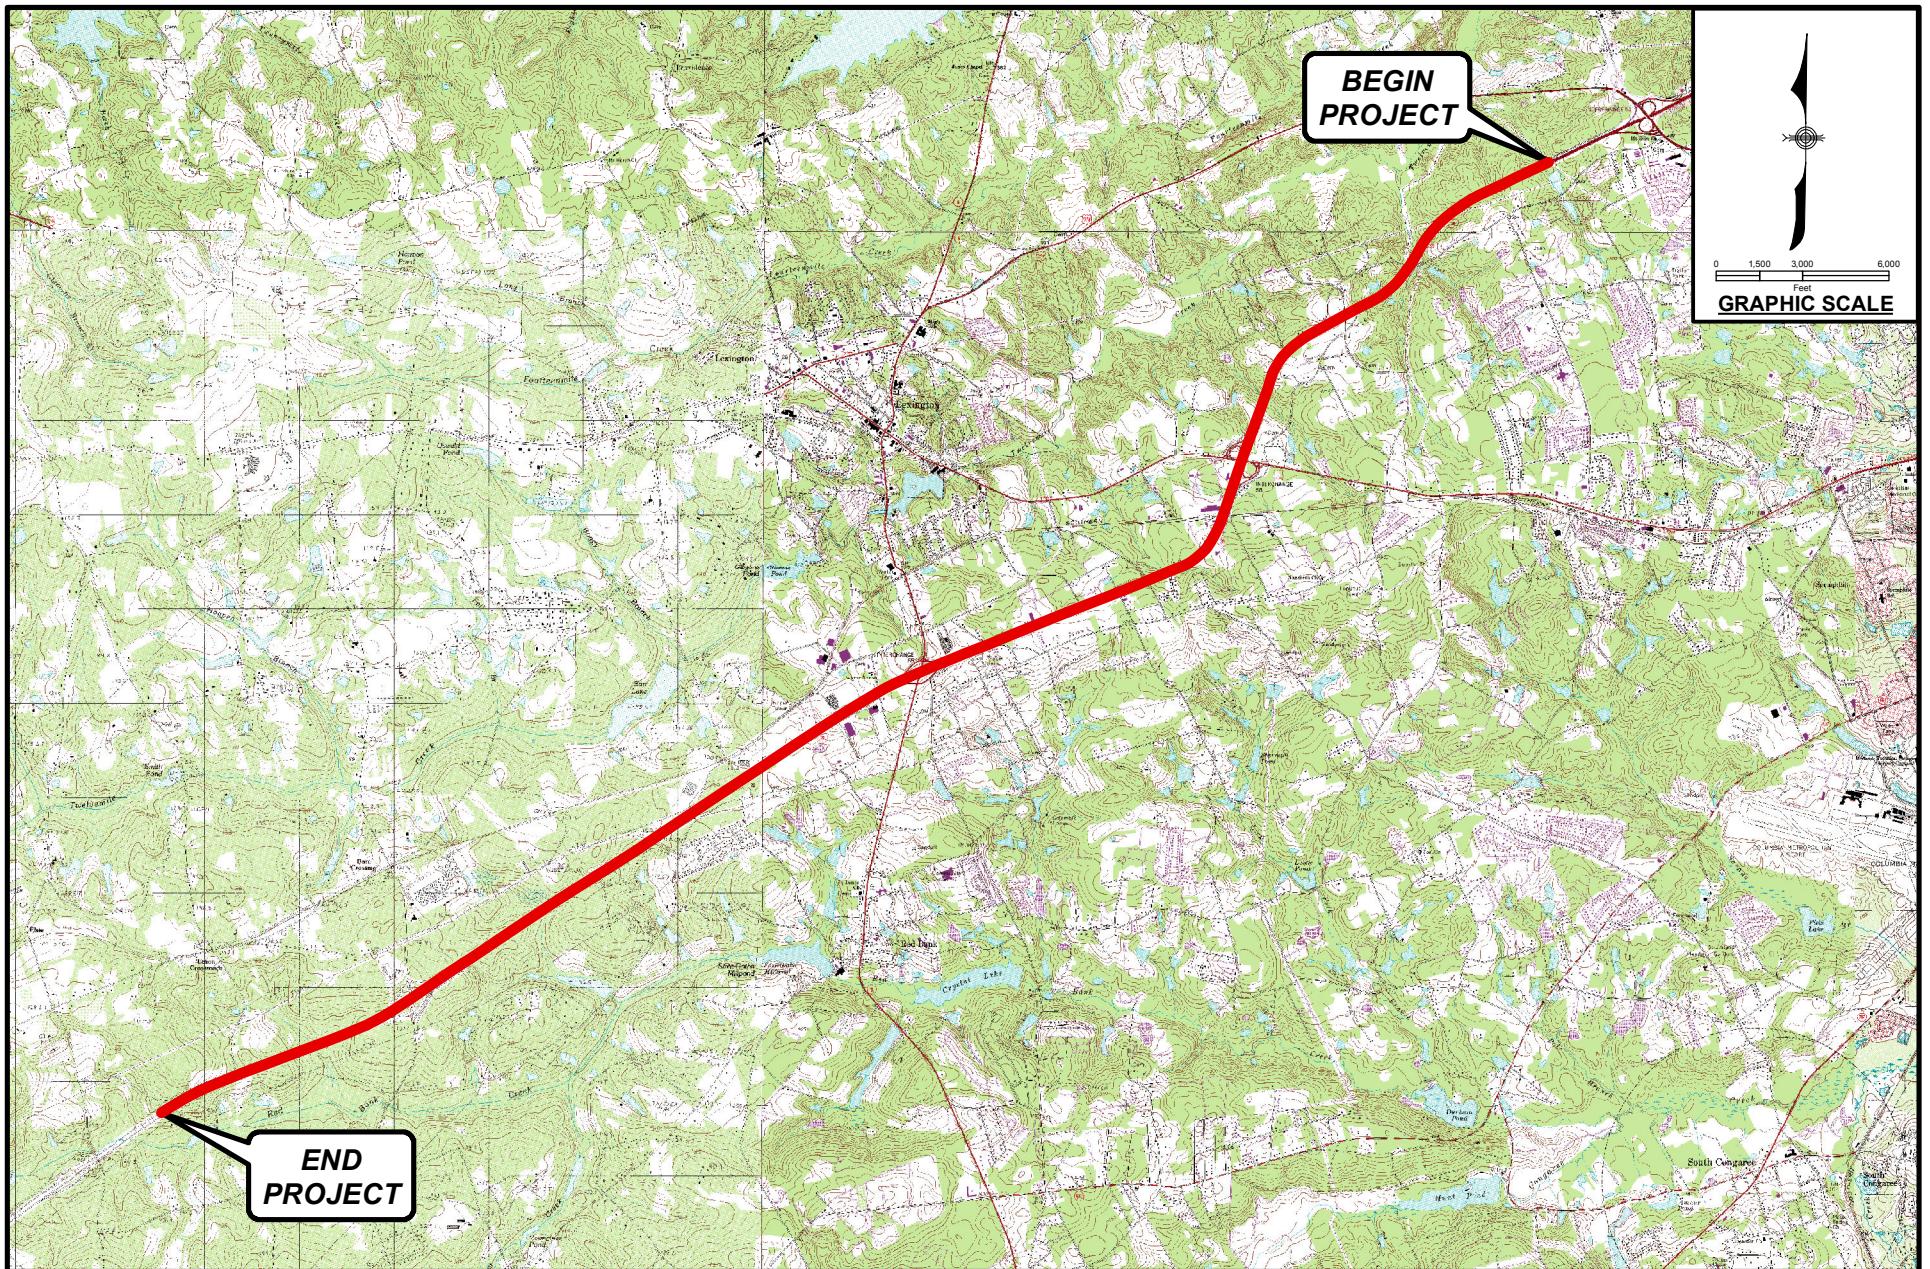

Discussion of geologic and geotechnical conditions observed in the field, observed from field sample recovery, observed in laboratory examination of samples and computed data analysis, which are all quantified in this data report, should be considered preliminary investigation and are subject to change upon the acquisition of additional data during the final investigation. More detailed subsurface investigation including additional borings and laboratory testing for the purposes of evaluating cut slopes, embankment slopes, embankment settlements, retaining walls and bridge foundation types and capacities will be required to ensure a sufficient confidence in selected design parameters. No other warranty, express or implied, is made. The Geotechnical Engineer of Record for the project must review the data submitted in this report and develop their own interpretation of the testing results as they apply to design.

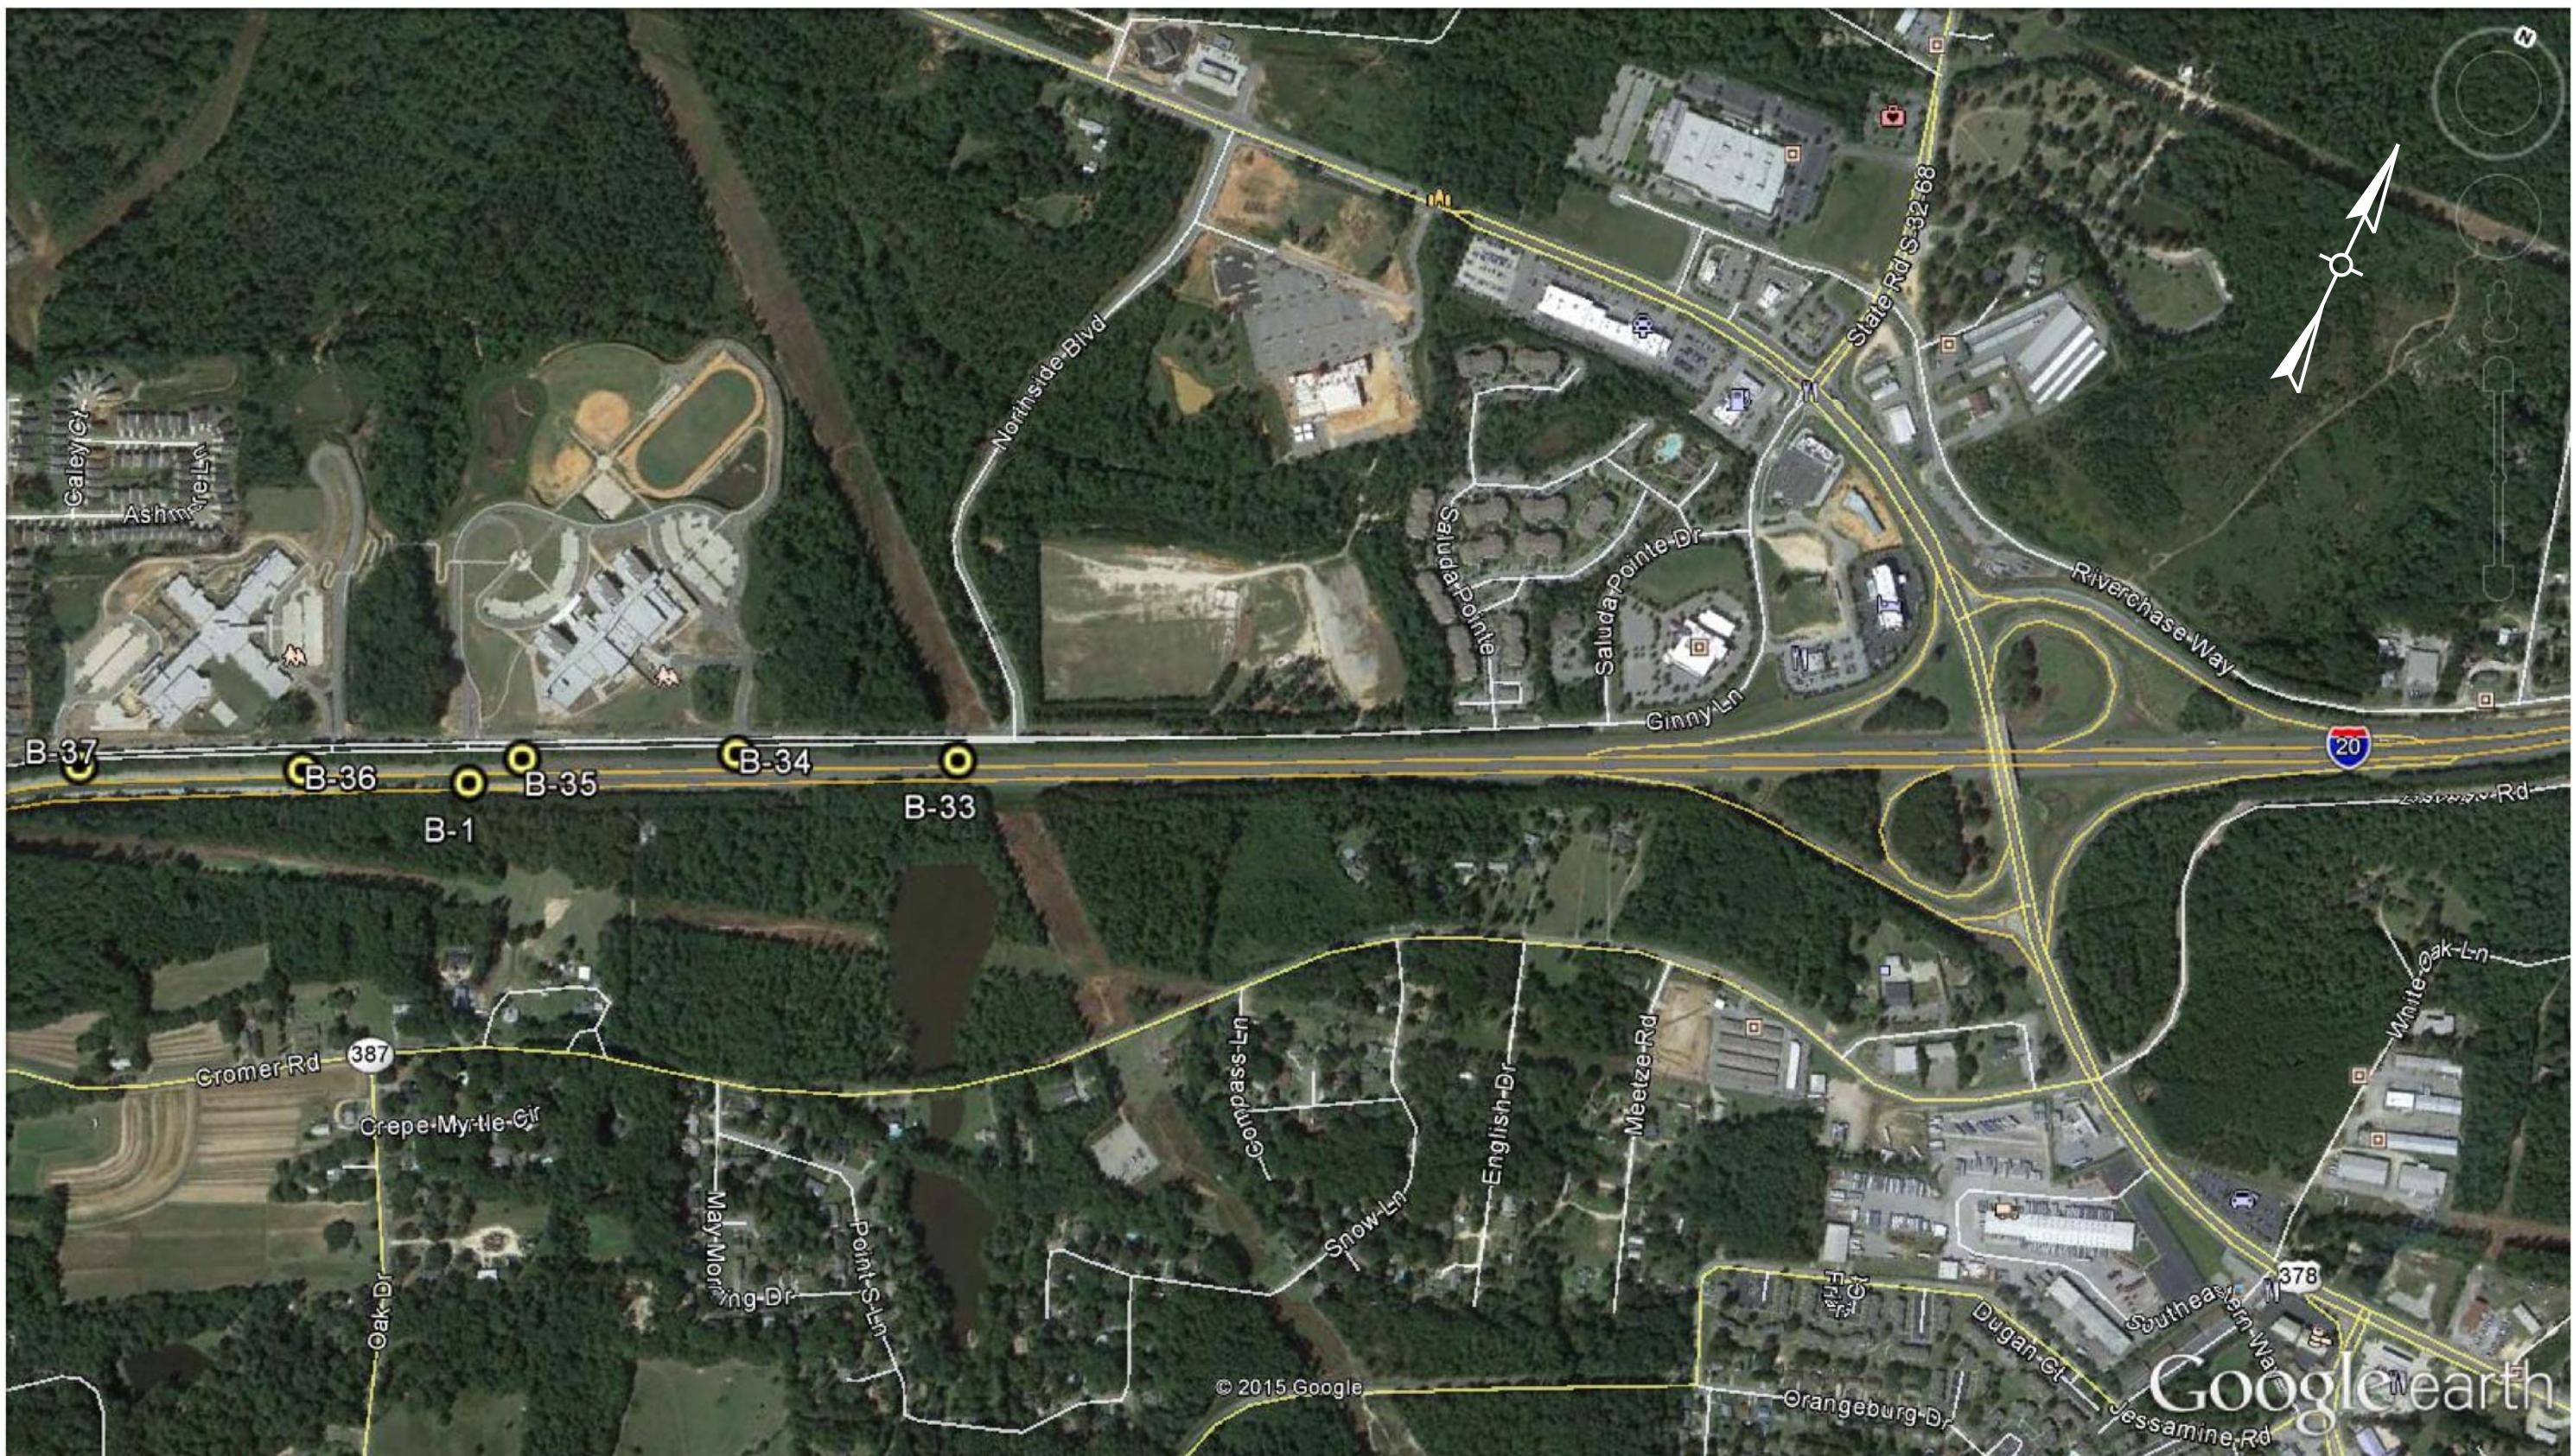

Bridge foundation recommendations shall be considered preliminary and subject to change upon the acquisition of additional data from the final subsurface investigation and structural design loading information. The preliminary recommendations in this report are meant to provide the designers and SCDOT with information to compare and analyze potential design recommendations and alternatives which might be proposed in a final, detailed design for the proposed bridge of I-20 over Norfolk Southern Railroad tracks and Meat Plant (Frontage) Road Lexington County, South Carolina. In addition, the preliminary design and recommendations discussed in this report shall not be a substitute for final design and recommendations for the proposed structure.

### I-20 BRIDGE AT CENTERLINE

## Appendix B. Soil Test Boring Logs & MASW Profile

File No.:	Project No. (PIN):			County:	Lexington		Eng./Geo.:	Z. Bruce
Site Description:		I-20 Roadway Improvements				Route:		I-20
Boring No.:	B-1	Boring Location:	226+34	Offset:	1' Lt.	Alignment:	Existing	
Elev.:	316.2 ft	Latitude:	34.00465	Longitude:	81.16507	Date Started:	2/6/2015	
Total Depth:	28.6 ft	Soil Depth:	28.6 ft	Core Depth:	0.0 ft	Date Completed:	2/6/2015	
Bore Hole Diameter (in):	4	Sampler Configuration		Liner Required:	Y	(N)	Liner Used:	Y
Drill Machine:	CME55	Drill Method:	DC	Hammer Type:	Automatic	Energy Ratio:	90%	
Core Size:	NA	Driller:	B. Cayton	Groundwater:	TOB	8.3 ft.	24HR	Dry

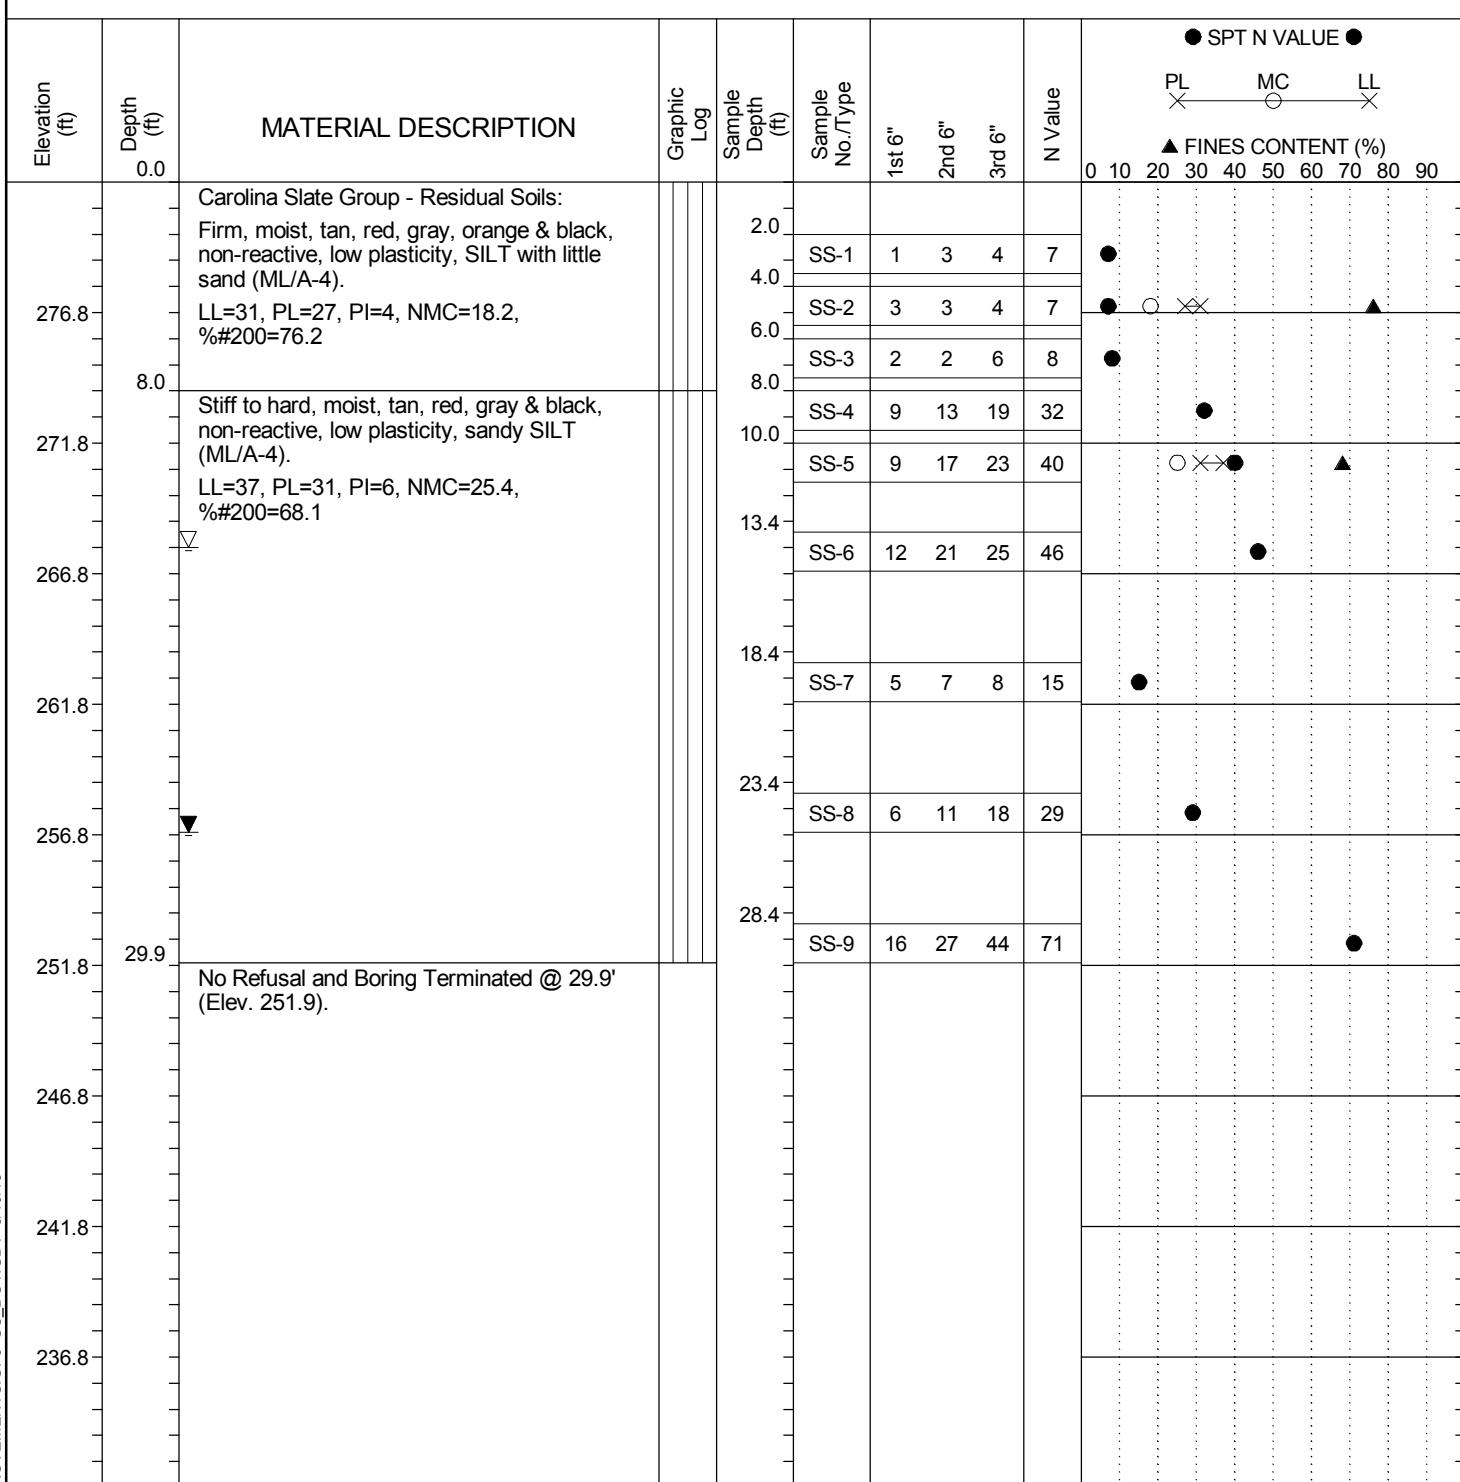

## LEGEND

SAMPLER TYPE			DRILLING METHOD		
SS - Split Spoon	NQ - Rock Core, 1-7/8"		HSA - Hollow Stem Auger	RW - Rotary Wash	
ST - Shelby Tube	CU - Cuttings		CFA - Continuous Flight Augers	RC - Rock Core	
AWG - Rock Core, 1-1/8"	CT - Continuous Tube		DC - Driving Casing

### Notes and Definitions

- M1 Matrix spike recovery is outside of acceptance limits, biased high.
- H1 Sample was received past holding time.
- DET Analyte DETECTED
- ND Analyte NOT DETECTED at or above the reporting limit
- NR Not Reported
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference

**File Location**

B-6A Bag-5 0.3-4.5 Remolded.HSD

**Project Information**

Project No. 14046-01  
 Project Name: I-20 D/B Roadway Improvement  
 Client:  
 Sample Location: B-6A Bag-5 0.3' to 4.5'  
 Sample Description: Tan, Red, Black & Gray Clayey Sand  
 Remarks: 3 Point Remolded

**Sample Data**

Sample Type: Remolded  
 Specific Gravity: 2.6500001  
 LL: 26.000  
 PL: 19.000

Sample Parameters	Initial	After Consolidation	Final
Diameter (in)	2.793	2.796	
Height (in)	5.508	5.499	
Weight (grams)	1155.00		1196.40
Moisture (%)	10.27		14.23
Dry Density (pcf)	118.22	118.21	
Saturation (%)	68.14	100.00	
Void Ratio	0.396	0.399	

**Test Data**

Rate of Strain: 0.005  
 Cell Pressure (psi): 98.100  
 Effective Confining Stress (psi): 20.0  
 Corrected Peak Deviator Stress (psi): 17.805 at reading number: 180

**File Location**

B-6A Bag-5 0.3-4.5 Remolded.HSD

**Project Information**

Project No: 14046-01  
 Project Name: I-20 D/B Roadway Improvement  
 Client:  
 Sample Location: B-6A Bag-5 0.3' to 4.5'  
 Sample Description: Tan, Red, Black & Gray Clayey Sand  
 Remarks: 3 Point Remolded

**Sample Data**

Sample Type: Remolded  
 Specific Gravity: 2.6500001  
 LL: 26.0000  
 PL: 19.0000

Sample Parameters	Initial	After Consolidation	Final
Diameter (in)	2.795	2.800	
Height (in)	5.511	5.486	
Weight (grams)	1155.90		1184.60
Moisture (%)	10.60		13.35
Dry Density (pcf)	117.77	117.83	
Saturation (%)	69.42	100.00	
Void Ratio	0.402	0.404	

**Test Data**

Rate of Strain: 0.005  
 Cell Pressure (psi): 119.900  
 Effective Confining Stress (psi): 40.0  
 Corrected Peak Deviator Stress (psi): 30.999 at reading number: 5

**Specimen C**

**Consolidated Undrained Triaxial Test (ASTM D4767)**

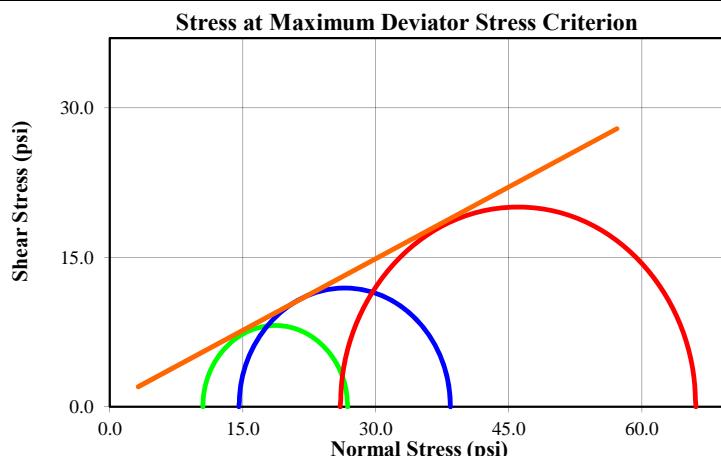

PROJECT NAME : I-20 D/B Roadway Improvement  
 PROJECT NO. : 14046-01  
 PROJECT LOCATION : B-6A Bag-6 4.5' to 10.0'  
 BORING NUMBER : B-6A  
 REMARKS : 3 Point Remolded

SAMPLE NO. : Bag-6  
 SAMPLE DEPTH : 4.5' to 10.0'  
 SAMPLE TYPE : Remolded  
 DESCRIPTION : Tan, Black & Gray Elastic Silt with Sand  
 TEST TYPE : Consolidated Undrained

	Specimen			
	Initial	A	B	C
Water Content (%)	20.5	20.4	20.5	
Dry Density (pcf)	94.1	93.6	94.0	
Saturation (%)	71.79	70.54	71.45	
Void Ratio	0.754	0.763	0.755	
Diameter (in)	2.806	2.808	2.807	
Height (in)	5.593	5.621	5.598	
Specific Gravity	2.65	2.65	2.65	
Liquid Limit	50	50	50	
Plastic Limit	33	33	33	
After Consolidation				
B-Value	0.96	0.96	0.96	
Water Content (%)	32.8	30.8	28.5	
Dry Density (pcf)	95.21	94.60	95.27	
Saturation (%)	100.00	100.00	100.00	
Void Ratio	0.738	0.749	0.736	
Effective Stress (psi)	10.0	20.0	40.0	
Back Press. (psi)	62.3	63.3	65.2	
Rate of Strain	0.0015	0.0015	0.0015	

Maximum Deviator Stress Criterion	After Shear				
	A	B	C	D	
C (psi)	3.2	$\sigma'_1$ at Failure (psi)	26.82	38.42	66.11
$\phi$ (deg)	16.6	$\sigma'_3$ at Failure (psi)	10.48	14.56	25.98
C' (psi)	0.5				
$\phi'$ (deg)	25.6				

Tested By: JS  
 Date: 3-6-15

Approved By: SKB  
 Date: 3-6-15

B-6A Bag-6 4.5-10.0 Remolded.HSD

**Project Information**

Project No. 14046-01  
 Project Name: I-20 D/B Roadway Improvement  
 Client:  
 Sample Location: B-6A Bag-6 4.5' to 10.0'  
 Sample Description: Tan, Black & Gray Elastic Silt with Sand  
 Remarks: 3 Point Remolded

**Sample Data**

Sample Type: Remolded  
 Specific Gravity: 2.6500001  
 LL: 50.000  
 PL: 33.000

Sample Parameters	Initial	After Consolidation	Final
Diameter (in)	2.806	2.798	
Height (in)	5.593	5.561	
Weight (grams)	1030.00		1135.20
Moisture (%)	20.52		32.83
Dry Density (pcf)	94.13	95.21	
Saturation (%)	71.79	100.00	
Void Ratio	0.754	0.738	

**Test Data**

Rate of Strain: 0.0015  
 Cell Pressure (psi): 72.300  
 Effective Confining Stress (psi): 10.0  
 Corrected Peak Deviator Stress (psi): 16.339 at reading number: 182

File Location  
 B-6A Bag-6 4.5-10.0 Remolded.HSD

**Project Information**

Project No. 14046-01  
 Project Name: I-20 D/B Roadway Improvement  
 Client:  
 Sample Location: B-6A Bag-6 4.5' to 10.0'  
 Sample Description: Tan, Black & Gray Elastic Silt with Sand  
 Remarks: 3 Point Remolded

**Sample Data**

Sample Type: Remolded  
 Specific Gravity: 2.6500001  
 LL: 50.000  
 PL: 33.000

Sample Parameters	Initial	After Consolidation	Final
Diameter (in)	2.808	2.812	
Height (in)	5.621	5.549	
Weight (grams)	1030.20		1119.20
Moisture (%)	20.41		30.81
Dry Density (pcf)	93.64	94.60	
Saturation (%)	70.54	100.00	
Void Ratio	0.763	0.749	

**Test Data**

Rate of Strain: 0.0015  
 Cell Pressure (psi): 83.300  
 Effective Confining Stress (psi): 20.0  
 Corrected Peak Deviator Stress (psi): 23.858      at reading number: 184

**Specimen B**

## File Location

B-6A Bag-6 4.5-10.0 Remolded.HSD

**Project Information**

Project No. 14046-01  
 Project Name: I-20 D/B Roadway Improvement  
 Client:  
 Sample Location: B-6A Bag-6 4.5' to 10.0'  
 Sample Description: Tan, Black & Gray Elastic Silt with Sand  
 Remarks: 3 Point Remolded

**Sample Data**

Sample Type: Remolded  
 Specific Gravity: 2.6500001  
 LL: 50.000  
 PL: 33.000

Sample Parameters	Initial	After Consolidation	Final
Diameter (in)	2.807	2.816	
Height (in)	5.598	5.490	
Weight (grams)	1030.10		1099.10
Moisture (%)	20.47		28.53
Dry Density (pcf)	94.04	95.27	
Saturation (%)	71.45	100.00	
Void Ratio	0.755	0.736	

**Test Data**

Rate of Strain: 0.0015  
 Cell Pressure (psi): 105.200  
 Effective Confining Stress (psi): 40.0  
 Corrected Peak Deviator Stress (psi): 40.128      at reading number: 183

**Consolidated Undrained Triaxial Test (ASTM D4767)**

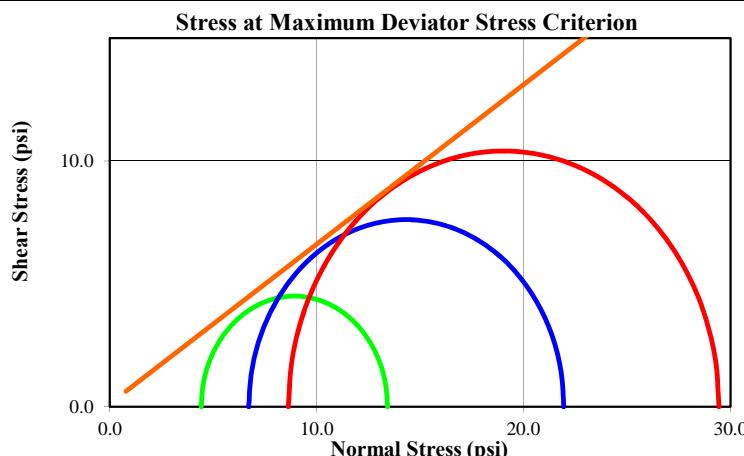

PROJECT NAME : I-20 D/B Roadway Improvement  
 PROJECT NO. : 14046-01  
 PROJECT LOCATION : B-27A Bag-3 7.3' to 26.5'  
 BORING NUMBER : B-27A  
 REMARKS : 3 Point Remolded

SAMPLE NO. : Bag-3  
 SAMPLE DEPTH : 7.3' to 26.5'  
 SAMPLE TYPE : Remolded  
 DESCRIPTION : White, Tan & Black Clayey Sand  
 TEST TYPE : Consolidated Undrained

	Specimen			
	Initial	A	B	C
Water Content (%)	8.7	8.6	8.9	
Dry Density (pcf)	116.3	114.6	115.4	
Saturation (%)	54.81	51.23	54.70	
Void Ratio	0.419	0.440	0.430	
Diameter (in)	2.782	2.799	2.788	
Height (in)	5.535	5.552	5.540	
Specific Gravity	2.65	2.65	2.65	
Liquid Limit	28	28	28	
Plastic Limit	18	18	18	
After Consolidation				
B-Value	0.96	0.96	0.96	
Water Content (%)	15.6	15.3	14.8	
Dry Density (pcf)	116.64	115.81	116.40	
Saturation (%)	100.00	100.00	100.00	
Void Ratio	0.418	0.428	0.421	
Effective Stress (psi)	10.0	20.0	40.0	
Back Press. (psi)	79.0	99.2	78.9	
Rate of Strain	0.006	0.006	0.006	

Maximum Deviator Stress Criterion	After Shear	Specimen				
		A	B	C	D	
C (psi)	1.2	$\sigma'$ 1 at Failure (psi)	13.43	21.95	29.45	
$\phi$ (deg)	14.0	$\sigma'$ 3 at Failure (psi)	4.42	6.72	8.63	
C' (psi)	0.1					
$\phi'$ (deg)	33.0					

Tested By: JS  
 Date: 3-25-15

Approved By: SKB

**Project Information**

Project No. 14046-01  
 Project Name: I-20 D/B Roadway Improvement  
 Client:  
 Sample Location: B-27A Bag-3 7.3' to 26.5'  
 Sample Description: White, Tan & Black Clayey Sand  
 Remarks: 3 Point Remolded

**Sample Data**

Sample Type: Remolded  
 Specific Gravity: 2.6500001  
 LL: 28.000  
 PL: 18.000

Sample Parameters	Initial	After Consolidation	Final
Diameter (in)	2.782	2.783	
Height (in)	5.535	5.515	
Weight (grams)	1116.90		1187.50
Moisture (%)	8.73		15.61
Dry Density (pcf)	116.33	116.64	
Saturation (%)	54.81	100.00	
Void Ratio	0.419	0.418	

**Test Data**

Rate of Strain: 0.006  
 Cell Pressure (psi): 89.000  
 Effective Confining Stress (psi): 10.0  
 Corrected Peak Deviator Stress (psi): 9.011 at reading number: 184

**File Location**

B-27A Bag-3 7.3-26.5 Remolded.HSD

**Project Information**

Project No. 14046-01  
 Project Name: I-20 D/B Roadway Improvement  
 Client:  
 Sample Location: B-27A Bag-3 7.3' to 26.5'  
 Sample Description: White, Tan & Black Clayey Sand  
 Remarks: 3 Point Remolded

**Sample Data**

Sample Type: Remolded  
 Specific Gravity: 2.6500001  
 LL: 28.000  
 PL: 18.000

Sample Parameters	Initial	After Consolidation	Final
Diameter (in)	2.799	2.793	
Height (in)	5.552	5.521	
Weight (grams)	1116.20		1185.00
Moisture (%)	8.57		15.26
Dry Density (pcf)	114.62	115.81	
Saturation (%)	51.23	100.00	
Void Ratio	0.440	0.428	

**Test Data**

Rate of Strain: 0.006  
 Cell Pressure (psi): 119.200  
 Effective Confining Stress (psi): 20.0  
 Corrected Peak Deviator Stress (psi): 15.234 at reading number: 184

**Specimen B**

## File Location

B-27A Bag-3 7.3-26.5 Remolded.HSD

**Project Information**

Project No. 14046-01  
 Project Name: I-20 D/B Roadway Improvement  
 Client:  
 Sample Location: B-27A Bag-3 7.3' to 26.5'  
 Sample Description: White, Tan & Black Clayey Sand  
 Remarks: 3 Point Remolded

**Sample Data**

Sample Type: Remolded  
 Specific Gravity: 2.6500001  
 LL: 28.000  
 PL: 18.000

Sample Parameters	Initial	After Consolidation	Final
Diameter (in)	2.788	2.787	
Height (in)	5.540	5.497	
Weight (grams)	1116.40		1175.80
Moisture (%)	8.95		14.75
Dry Density (pcf)	115.40	116.40	
Saturation (%)	54.70	100.00	
Void Ratio	0.430	0.421	

**Test Data**

Rate of Strain: 0.006  
 Cell Pressure (psi): 118.900  
 Effective Confining Stress (psi): 40.0  
 Corrected Peak Deviator Stress (psi): 20.821      at reading number: 184

Energy Measurements						
Representative plot of force and velocity for each data set attached	<input checked="" type="checkbox"/> Plots of average energy and all energy versus Rod Length attached	<input checked="" type="checkbox"/> Tabular and graphical data for each blow for each data set attached	<input checked="" type="checkbox"/>			
Data Set ID	Instrumentation to Sampler Tip Length (ft.) <sup>(1)</sup>	Blows Recorded to Drive Sampler/N-value	Soil Sample Description	Average BPM for Increment <sup>(2)</sup>	Average Maximum Energy (k-ft.)	Average Energy Transfer Ratio (percent)
1	30.83	4-4-4 / 8	Coarse Sand	51.7	0.31	90.0
2	35.83	3-5-6 / 11	Clay/Fine to Coarse Sand	51.7	0.31	89.8
3	40.83	3-4-4 / 8	Clay/Fine to Coarse Sand	52.2	0.32	91.0
4	45.83	0-3-3 / 6	Clay/Fine to Coarse Sand	51.2	0.32	92.7
5	50.83	0-3-3 / 6	Clay/Fine to Coarse Sand	52.7	0.32	92.3
6	55.83	0-4-3 / 7	Clay/Fine to Coarse Sand	52.8	0.32	91.7
7	60.83	2 <sup>(3)</sup> -4-7 / 11	Clay/Coarse Sand	52.8	0.30	86.7
1. Penetration below grade is approximately 3.0 to 4.5 feet less than length shown for instrumentation to sampler tip for each increment. 2. First blow for each increment ignored when computing average. 3. Driller recorded three blows for this increment for a total of 14 blows. PDA record only had 13 total blows. Applied a one blow reduction to first increment to account for discrepancy.						
Energy Measurement Interpretation						
Seven increments of data were gathered. The averages for energy (EFV) and the energy transfer ratio (ETR) for each increment are tabulated in the above table. In addition, the above table includes the N-value and soil sample description for each increment.						
Plots of average ETR versus rod length below instrumentation and ETR for each blow versus rod length below instrumentation are included in Appendix A. Additional information regarding each blow recorded for each increment can be found in Appendices B through H. A plot showing representative force and velocity traces, input parameters, gage information, and output quantities is also included in Appendices B through H for a representative blow for each increment. Please note in the attached plots in Appendices B through H the penetration is estimated and based on depth of the tip of the sampler below existing ground. Refer to the LE values in the tabulated data and plots for the actual rod length below gages.						

The overall average EFV and ETR values (for all recorded blows) are approximately 0.32 k-ft and 90.1 percent, respectively. The overall standard deviation for all data for EFV and ETR are 0.01 k-ft or 3.54 percent, respectively.

### Limitations

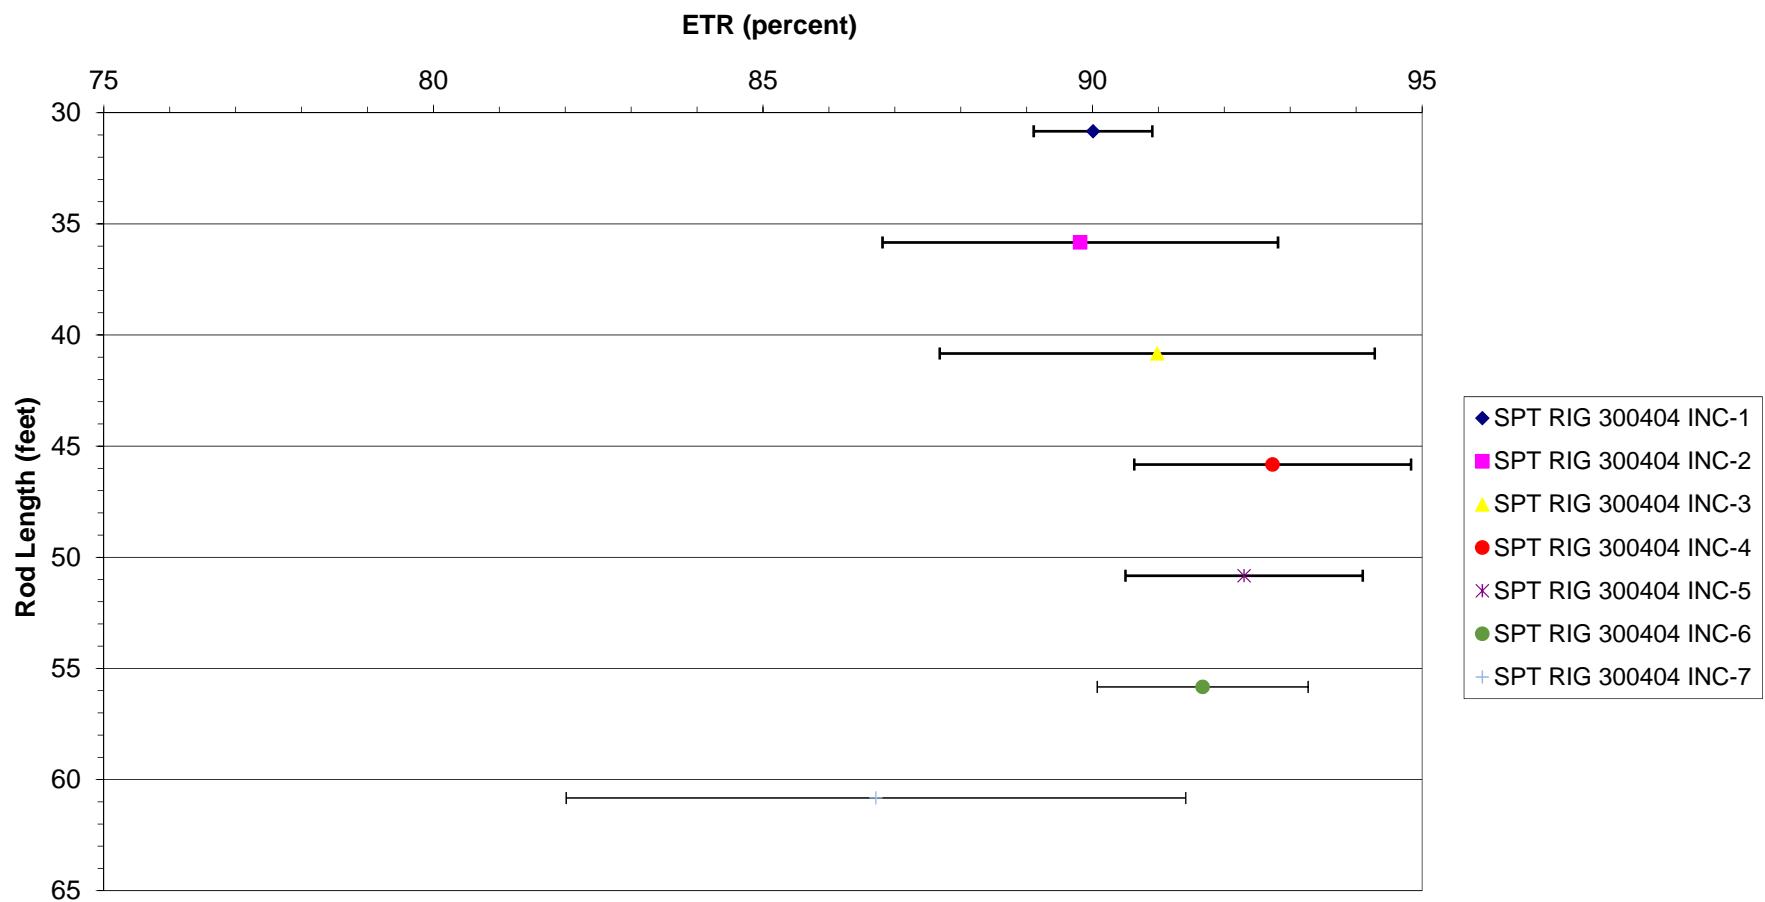

This report presents test measurements made by AFT. Interpretations were made based upon the measurements made by AFT with the latest techniques available and currently accepted standards of care recognized by Geotechnical Engineering professionals. AFT is an independent agency and is not the Geotechnical Engineer of Record. The Geotechnical Engineer of Record should ultimately make final recommendations for foundation design and construction.

## Report of Standard Penetration Test (SPT) Energy Measurement Testing

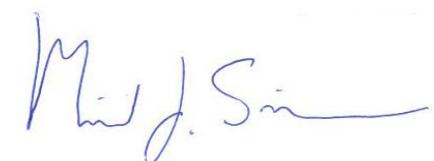

CME Model 55 Rig with Auto  
Hammer  
Rig Serial No.: 379935  
Lexington, South Carolina  
AFT Project No.: 215006NC

### Authored By:

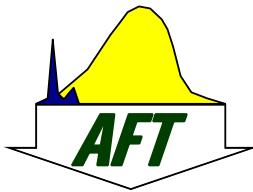

Thomas G. Santee, P.E.  
Chief Engineer  
Certified PDA Signatory - Advanced

For: Mr. Tom Rideout  
ICA Engineering, Inc.  
trideout@icaeng.com

Michael J. Simpson, P.E  
Geotechnical Engineer  
NC Registration No.: 032060  
Certified PDA Signatory - Advanced

**Applied Foundation Testing**  
Specializing in STATNAMIC™ Load Testing,  
Dynamic and Static Load Testing, Instrumentation  
and Geotechnical Engineering

**Report of SPT Energy Measurement Testing  
In General Accordance to ASTM D 4633**

General Information				
Date:	February 5, 2015			
AFT Project No.:	215006NC			
Project Description:	SPT Energy Measurement Testing of Drill Rig			
Client Name:	ICA Engineering, Inc.			
Client Address:	trideout@icaeng.com			
Client Contact:	Mr. Tom Rideout			
Test Date:	February 3, 2015			
Test Equipment Manufacturer/Model:	Pile Dynamics, Inc. / Model PAX (strain and accelerometer calibrations attached in Appendix F)			
AFT Field Personnel:	Michael J. Simpson, P.E.			
AFT Responsible Engineer:	Michael J. Simpson, P.E.			
Drill Rig Information				
Manufacturer	Model	Serial Number	Operator	Type
CME	55	379935	ICA	ATV (Track)
Hammer Information				
Type	Model	Serial Number		
Auto	CME	N/A		
Anvil Height (in.)	Anvil Diameter (in.)	Drop Height (in.)	Ram Weight (lb.)	Ram Serial Number
13	~2.5	30	140	N/A
Drilling Rod Information				
Type	OD (in.)	ID (in.)	Cross Sectional Area (in <sup>2</sup> )	Typical Length (ft.)
AWJ	~1.75	~1.25	~1.20	1 to 5
Instrumented Rod Type	OD (in.)	ID (in.)	Cross Sectional Area (in <sup>2</sup> )	Length (ft.)
AWJ	~1.75	~1.25	~1.20	2

Boring Information												
ID	Location	Reference Elevation (ft.)	Impact to Instrumentation Length (ft.)	Boring Log Attached (Y or N)								
Unknown	Gore Area of I-20 Eastbound On-Ramp from Exit 51 and Eastbound I-20 Near Lexington, SC	Unknown	2.3	N								
Results												
Energy Measurements												
Representative plot of force and velocity for each data set attached	<input checked="" type="checkbox"/>	Plots of average energy and all energy versus Rod Length attached	<input checked="" type="checkbox"/>	Tabular and graphical data for each blow for each data set attached								
<input checked="" type="checkbox"/>				<input checked="" type="checkbox"/>								
Data Set ID	Instrumentation to Sampler Tip Length (ft.) <sup>(1)</sup>	Blows Recorded to Drive Sampler/N-value	Soil Sample Description	Average BPM for Increment <sup>(2)</sup>	Average Maximum Energy (k-ft.)	Average Energy Transfer Ratio (percent)						
1	28.5	2-5-13 / 18	Medium Dense Sand	54.9	0.31	88.9						
2	33.5	3-5-6 / 11	Medium Dense Silty Sand	55.0	0.31	89.6						
3	38.5	3-7-10 / 17	Medium Dense Sand with Silt	54.9	0.32	91.5						
4	44.5	5-6-7 / 13	Medium Dense Silty Sand	55.3	0.32	91.2						
1.	Penetration below grade is approximately 4.2 feet less than length shown for instrumentation to sampler tip.											
2.	First blow for each increment ignored when computing average.											
Energy Measurement Interpretation												
Four increments of data were gathered. The averages for energy (EFV) and the energy transfer ratio (ETR) for each increment are tabulated in the above table. In addition, the above table includes the N-value and soil sample description for each increment.												
Plots of average ETR versus rod length below instrumentation and ETR for each blow versus rod length below instrumentation are included in Appendix A. Additional information regarding each blow recorded for each increment can be found in Appendices B through E. A plot showing representative force and velocity traces, input parameters, gage information, and output quantities is also included in Appendices B through E for a representative blow for each increment. Please note in the attached plots in Appendices B through E the penetration is estimated and based on depth of the tip of the sampler below existing ground. Refer to the LE values in the tabulated data and plots for the actual rod length below gages.												
The overall average ETR and ETR values (for all recorded blows) are approximately 0.32 k-ft and 90.3 percent, respectively. The overall standard deviation for all data for ETR and ETR are 0.01 k-ft and 1.9 percent, respectively.												

## Limitations

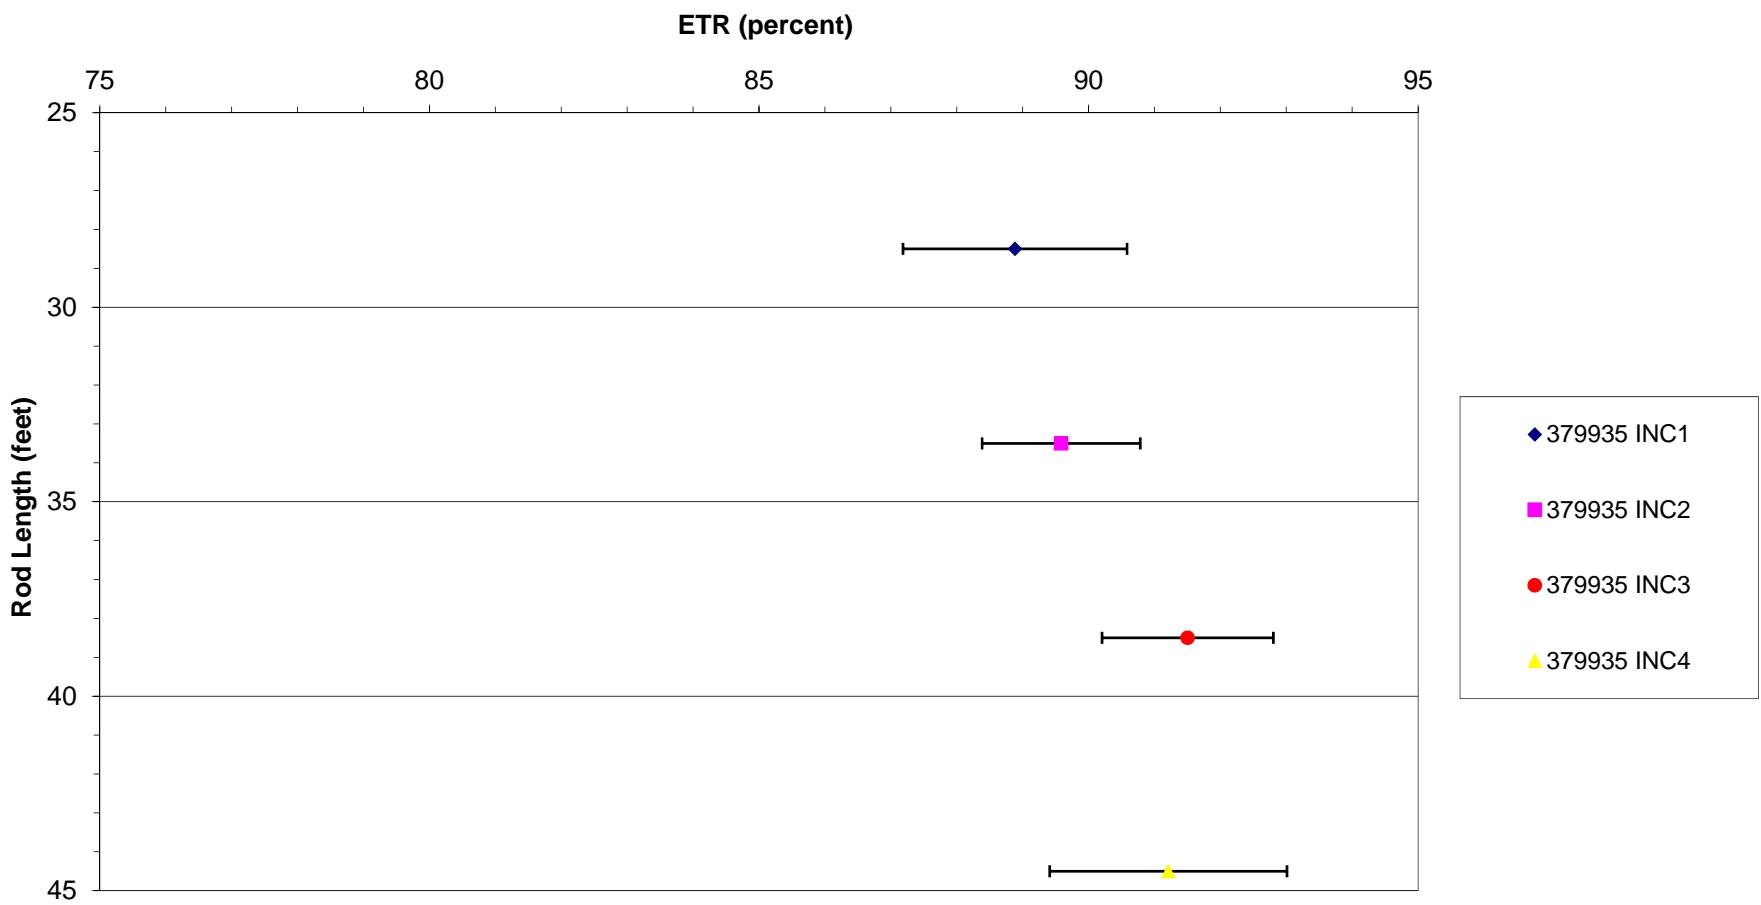

This report presents test measurements made by AFT. Interpretations were made based upon the measurements made by AFT with the latest techniques available and currently accepted standards of care recognized by Geotechnical Engineering professionals. AFT is an independent agency and is not the Geotechnical Engineer of Record. The Geotechnical Engineer of Record should ultimately make final recommendations for foundation design and construction.
