# 1. EXECUTIVE SUMMARY

This executive summary is intended as an overview for the convenience of the reader. This report should be reviewed in its entirety prior to making any decisions regarding this project.

F&ME Consultants, Inc. (FME) has completed an Asbestos Containing Material (ACM) Investigation of the S-86 (Rock House Rd.) Bridge over Kings Creek (Bridge) in Cherokee County, South Carolina at the request of HDR (Client). The field investigation was performed on June 7, 2022, in anticipation of an on-alignment replacement of the existing Bridge. This investigation was also conducted pursuant to South Carolina Department of Health and Environmental Control (SCDHEC), United States Environmental Protection Agency (USEPA), National Emission Standards for Hazardous Air Pollutants (NESHAP), and Occupational Safety and Health Administration (OSHA) regulations requiring an ACM investigation prior to any demolition activities.

Per an agreed upon scope of work, FME performed this investigation to identify any ACM that might be encountered during the demolition activities, associated with the existing Bridge, and to provide recommendations regarding proper handling and disposal of any ACM found. The investigation of the Bridge identified one (1) suspect material: timber pile cap felt. During the field investigation, FME personnel collected samples of this material and assessed its physical condition. **Laboratory results indicated that the suspect material sampled during this investigation contained no asbestos.** Therefore, at this time, no special handling or disposal requirements are required regarding ACM. However, during the course of demolition activities, previously concealed ACM might be discovered. If ACM is found, the affected contractor(s) must stop work, take appropriate actions, and notify the Owner/asbestos Consultant for an appropriate response action. The SCDHEC must be notified if any suspect ACM is discovered.

We sincerely appreciate the opportunity to assist you with this project. Should you have any questions or require additional information concerning this Investigation, please do not hesitate to contact our office at (803) 254-4540.

Sincerely,

F&ME CONSULTANTS

## 2. INTRODUCTION

FME has completed an ACM investigation of the S-86 (Rock House Road) over Kings Creek, in Cherokee County, South Carolina. The investigation was performed on June 7, 2022. This investigation was conducted pursuant to SCDHEC, USEPA, NESHAP, and OSHA regulations which require an ACM investigation prior to any demolition activities. See Appendix A – Site Vicinity Map for the location of the Bridge.

It is our understanding that the proposed project will include the complete demolition and removal of the existing Bridge, and replacement with a new Bridge on the existing horizontal alignment. The purpose of this investigation was to determine if asbestos was present on the existing Bridge by identifying and sampling suspect ACM, obtaining analytical results, quantifying any confirmed ACM, and assessing the physical condition of the ACM, where possible.

This report has been prepared exclusively for the Client and shall not be disseminated in whole or part to other parties without prior consent from Client or FME. No other environmental issues were addressed as part of this report.

## 3. EXISTING BRIDGE STRUCTURE

The existing Bridge (~151.0'L x 24.0'W, inside curb to inside curb), is located on S-86 (Rock House Rd.) and crosses over Kings Creek in Cherokee County, South Carolina. The construction date of the Bridge is unknown. The existing Bridge is a precast five (5) span, two lane concrete Bridge supported by timber piles with an asphalt overlay. The concrete bridge decking and curb/gutter system is supported by four (4) poured-in-place interior concrete bent caps and two (2) concrete end bents. Each concrete bent cap is supported by five (5) timber piles. Concrete drainage scuppers were observed along each side of the Bridge. Galvanized metal guardrails with wooden posts are attached to the concrete curb on each side of the Bridge. Refer to Appendix A – Site Vicinity Map, for the location of the Bridge.

*Photo 1: S-86 (Rock House Road) over Kings Creek in Cherokee County, South Carolina*

## 4. FIELD ASSESSMENT

During the investigation, all accessible bridge components (i.e., timber bent caps, and timber piles) were visually inspected for suspect ACM. Examples of possible suspect materials include bent and pile cap felt, bearing pads, expansion joint material, and drainage scuppers. The concrete bridge deck rested directly on the concrete bent caps which are supported by timber piles. One (1) suspect material was observed/visible on the Bridge. The suspect material noted on the Bridge was the timber pile cap felt. Samples of this material were taken from random locations on the Bridge. See Appendix B – Sample Location Plan, for detailed sample locations. Also, see Appendix G – Site Photographs, for more details.

## 5. ASSESSMENT RESULTS

During the investigation, timber pile cap felt material was the only material identified associated with the Bridge. A total of three (3) samples were taken, for laboratory analysis, and the physical characteristics were recorded. The remaining structural materials (i.e., wood, steel, etc.) were not considered suspect and were not sampled.

Random samples of these suspect materials were collected for laboratory analysis, and their physical characteristics were recorded. Building materials such as concrete, metal, wood, brick, carpet, etc., were not considered suspect ACM. Bulk samples of the suspect materials were analyzed by polarized light microscopy (PLM) in accordance with EPA 600/R-93/116. A “*first positive stop*” protocol was implemented for sample testing. This protocol establishes that if the first sample of a material tested positive for asbestos content, subsequent samples were not to be analyzed, and would be considered positive as well. A total of two (2) samples were analyzed by PLM and one (1) sample was TEM-confirmed. **The results of the analysis indicated that the suspect timber pile cap felt sampled during this investigation contained no asbestos.** Results of laboratory analysis are summarized in Appendix C – Summary of Sample Results.

Appropriate sampling and chain-of-custody protocols were followed to ensure proper handling and delivery of samples to the analytical laboratory. Appendix D – Bulk Asbestos Analytical Report and Appendix E – Laboratory Chain of Custody were provided to show laboratory documentation of the analytical results. Appendix F – Personnel Certification, provides the qualifications for the FME Asbestos Inspectors.

## 6. RECOMMENDATIONS

The results, conclusions, and recommendations of this Investigation are representative of the conditions observed at the site on the date of the field investigation. FME does not assume responsibility for any changes in conditions or circumstances that may have occurred after this investigation.

It is our understanding that the subject structure is to be demolished in anticipation of an on-alignment replacement of the existing Bridge. **The results of the analysis indicate that the timber pile cap felt material sampled during this investigation contained no asbestos.** Therefore, there are no foreseen special handling or disposal requirements, regarding asbestos, that will be required for the demolition of this bridge.

If any concealed and/or inaccessible suspect ACM are encountered during the demolition activities, the affected contractor(s) must stop work, take appropriate actions, and notify the Owner/asbestos Consultant for an appropriate response action. The SCDHEC must be notified if any suspect ACM is discovered.

This report has been prepared exclusively for the Client and FME and shall not be disseminated in whole or in part to other parties without prior consent from the Client and FME. Use of this document for bidding purposes is not recommended without prior consultation with FME.

We sincerely appreciate the opportunity to be of service to HDR in this matter. If you have any questions regarding the information presented herein, please contact our office at (803) 254-4540.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.
