1. Introduction

The Carolina Crossroads Project includes three interstate routes (I-20/I-26/I-126) and incorporates the modification of the I-20/I-26 system interchange (Exit 64/Exit 107) and the I-26/I-126 system interchange (Exit 108). I-20 is an east-west interstate highway that begins near Kent, Texas at I-10. From this origin, I-20 runs eastward through Texas, Mississippi, Alabama, Georgia, and South Carolina where it ends at I-95 in Florence, South Carolina. I-26 is an east-west interstate highway that begins at the junction of U.S. Route 11W and U.S. Route 23 in Kingsport, Tennessee. From this origin, I-26 runs generally southeastward through Tennessee, North Carolina, and South Carolina, where it ends at U.S. Route 17 in Charleston, South Carolina. I-126 is an east-west auxiliary route of I-26 that begins and ends in Columbia, South Carolina.

The proposed project is a transportation corridor improvement located in Lexington and Richland counties. To date, the project area has been defined as a mainline corridor including I-20 from US 378 to the Broad River (approximately five miles), I-26 from Broad River Road to US 378 (approximately nine miles), and I-126 from I-26 to Grey Stone Boulevard (approximately two miles). **Figure 1** illustrates the extent of the Carolina Crossroads Project study area.

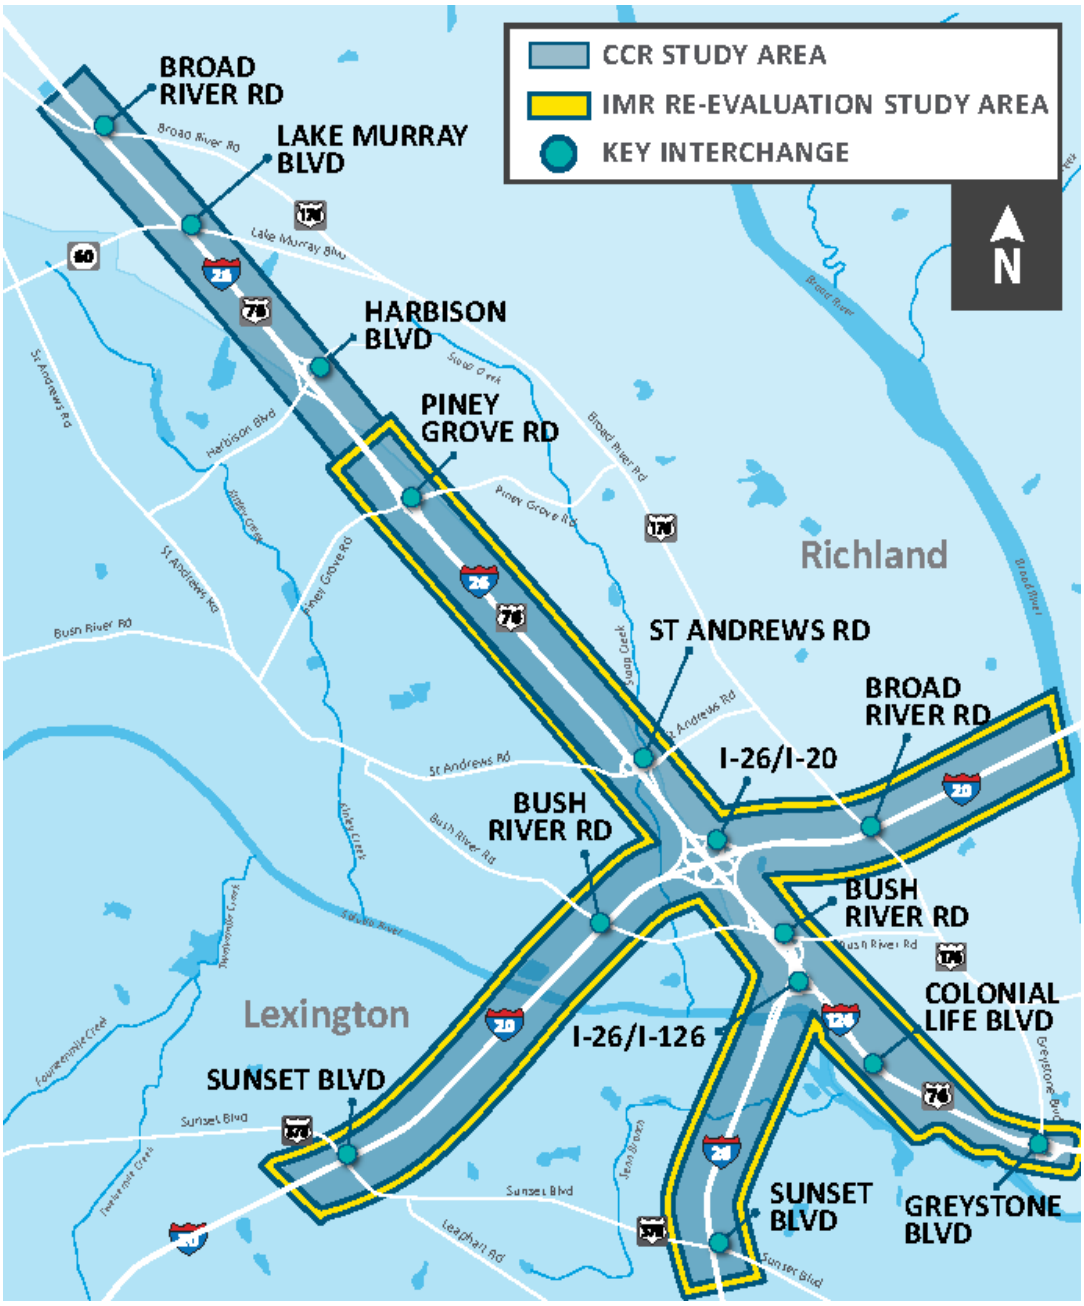
The original I-20/I-26/I-126 Systems Interchange Modification Report (IMR), dated May 2019, evaluated the anticipated interchange modifications as depicted in the Final Environmental Impact Statement (FEIS) for the project. Since the approval of the 2019 Systems IMR, the Carolina Crossroads has been separated into five construction phases. The first three phases of the Carolina Crossroads Project comprise most of the work documented in the 2019 Systems IMR. Improvements to the I-126 at Colonial Life Boulevard interchange are now part of Phase 1 of the Carolina Crossroads Project Delivery, while the I-20 Exit 65 Interchange at Broad River Road is now part of Phase 2. Phases 1 and 2 are both under construction as design-build projects, and the construction is expected to be completed in 2025. The improvements to I-20/I-26/I-126 system interchanges, along with I-20 Exit 63 (Bush River Road) and I-26 Exit 106 (St. Andrews Road), were part of Phase 3, which was also to be a design-build project. Traffic Technical Memoranda addressing changes to the I-126 at Colonial Life Boulevard interchange and I-20 Exit 65 (Broad River Road) were submitted as part of the Phase 1 and Phase 2 design-build projects, ID P039718 and ID P039719, respectively, and included in subsequent National Environmental Policy Act (NEPA) Re-evaluations #1 and #5.

As the evolution of the Carolina Crossroads Project through the phased construction delivery is discussed, it is important to understand the key terms that define various milestones in the evolution of the design as it relates to the FEIS and the Record of Decision (ROD) for the Carolina Crossroads Project and the 2019 Systems IMR. The design concept depicted in the FEIS was referred to as the Refined Recommended Preferred Alternative (RRPA). Once the ROD was issued in May of 2019, the RRPA concept became known as the Selected Alternative (SA); however, many of the reference documents to the FEIS/ROD were not updated to reflect this change in nomenclature, including the 2019 Systems IMR. *Therefore, the terms RRPA and SA are synonymous.*

As the Carolina Crossroads Project has advanced through the initial construction phases and right-of-way acquisition, the design concept has been updated periodically. These updates include changes to the design associated with the final design that have been developed during Phases 1 and 2 and changes made to the design concept outside of Phases 1 and 2 based on refinements made during right-of-way acquisition throughout the entire limits of the Carolina Crossroads Project. The version of the design concept that includes all these changes is referred to as the Modified Selected Alternative (MSA).

This Systems IMR Re-evaluation documents the traffic and safety performance of the Build Alternative against the Selected Alternative. The Build Alternative includes the design refinements made since 2019 from multiple project phases' design-build procurements and project efforts throughout the entire limits of the Carolina Crossroads Project.

Figure 1 - Carolina Crossroads Project Study Area



1.1 Background

The following studies were conducted as a part of the Carolina Crossroads Project:

1.1.1 Alternatives Traffic Analysis (April 2019)

The traffic analysis of the Representative Alternatives (RA) consisted of an iterative process involving the development of traffic projections incorporating previously collected data, screening of interchange Accessory Options (AO) that led to the development of the individual RAs, evaluating microsimulation networks of individual RA concepts that included microsimulation model calibration, review of areas of congestion within each alternative, and preparation of measures of effectiveness to facilitate the comparison of individual RAs. As areas of congestion and improvements in conceptual design of the RA were addressed, the microsimulation networks were modified to incorporate improvements to the original RA concept. Detailed information regarding the alternatives development and screening process is contained in the Alternatives Development and Screening Report included in the FEIS.
The Alternatives Traffic Analysis evaluated multiple improvements within the I-20/I-26/I-126 corridor designed to reduce existing traffic congestion, upgrade interchanges to meet design requirements, and accommodate future traffic needs. The study considered widening of I-20 from three to four lanes in each direction from about one mile west of Exit 63 (Bush River Road) to the Broad River, widening of I-26 from three to four lanes in each direction from just west of Exit 101 (Broad River Road) to Exit 110 (US 378), and realigning the connection to I-126 from I-26 towards the Colonial Life Boulevard interchange. In addition, the study examined modifications to the I-20/I-26 system interchange, I-26/I-126 system interchange, Exit 101 (Broad River Road), Exit 102 (Lake Murray Boulevard), Exit 103 (Harbison Boulevard), Exit 104 (Piney Grove Road), Exit 106 (St. Andrews Road), Exit 108 (Bush River Road), Exit 110 (US 378), Exit 63 (Bush River Road), Exit 65 (Broad River Road), and the Colonial Life Boulevard interchange on I-126. The Study Area for the Alternatives Traffic Analysis is shown in **Figure 1**.

1.1.2 The approved Systems IMR (May 2019)

The information discussed in the approved Systems IMR (May 2019) is derived from the Alternatives Traffic Analysis (April 2019). This report focused on traffic analysis of existing, future no-build, and future build conditions. The study area and TransModeler (version 4) remained consistent with the Alternatives Traffic Analysis (April 2019). The traffic conditions were analyzed for the following scenarios:

- Existing Conditions: An analysis of existing conditions in the year 2015.
- 2040 No-Build: An analysis of conditions in the year 2040 with no changes to the interstate or interchanges.
- 2040 Build: An analysis of conditions in the year 2040 with modifications to the study area interstate and interchanges

As part of the project development, nine RAs for the entire Carolina Crossroads Project study area were developed and evaluated along with a tenth ‘no-build’ alternative. From these alternatives, the RRPA also known as the SA was identified. The I-20/I-26 and I-26/I-126 system interchanges and adjacent service interchanges in the RRPA were modified as follows:

- I-20/I-26 System Interchange: the existing full cloverleaf interchange (I-20 Exit 64 and I-26 Exit 107) will be modified to a directional ‘turbine’ interchange. Multiple existing complex weaving movements will be eliminated from the mainline and relocated to collector-distributor roads which will be constructed in each direction on I-20 and I-26 to separate movements traveling between I-20 and I-26 from through traffic on the mainline travel lanes.

- I-26/I-126 System Interchange: the existing interchange (I-26 Exit 108), which includes ramps from I-26 to Bush River Road, will be modified to eliminate the ramps to Bush River Road, improve the continuity of I-26, and revise the connection to and from I-126.
- I-20 Exit 63 (Bush River Road): the existing diamond interchange, which includes a loop on-ramp from eastbound Bush River Road to eastbound I-20, will be modified to provide a diverging diamond interchange. This modification includes eliminating the intersection of Berryhill Drive with Bush River Road and adding an overpass to connect Berryhill Drive over I-20 to Bush River Road via Rockland Road.
- I-20 Exit 65 (Broad River Road): the existing diamond interchange at Broad River Road, which includes a short, two-way segment on the eastbound on-ramp to connect Garner Lane to Broad River Road, will be modified to provide a single point urban interchange. The Garner Lane connection to the off-ramp was eliminated, making the interchange consistent with current standards and FHWA policy. A new connection was added to link Garner Road to Long Creek Drive.
- I-26 Exit 106 (St Andrews Road): the existing partial cloverleaf interchange includes a westbound loop off-ramp and eastbound loop on-ramp to and from westbound St Andrews Road. It will be modified to provide a single point urban interchange. The connections from the westbound off-ramp to eastbound St Andrews Road and to Burning Tree Drive will be maintained and adjusted to connect to the remainder of the modified interchange.
- I-26 Exit 110 (US 378): the existing single point urban interchange will remain unchanged; however, the eastbound off-ramp to US 378 will be relocated and extended by approximately 2,500 feet to reduce or eliminate the potential for off-ramp traffic queues from extending back to the eastbound I-26 mainline lanes.
- I-126 Colonial Life Boulevard: the existing partial interchange with ramps only oriented to and from downtown Columbia to the east will be replaced with a full access tight urban diamond interchange.

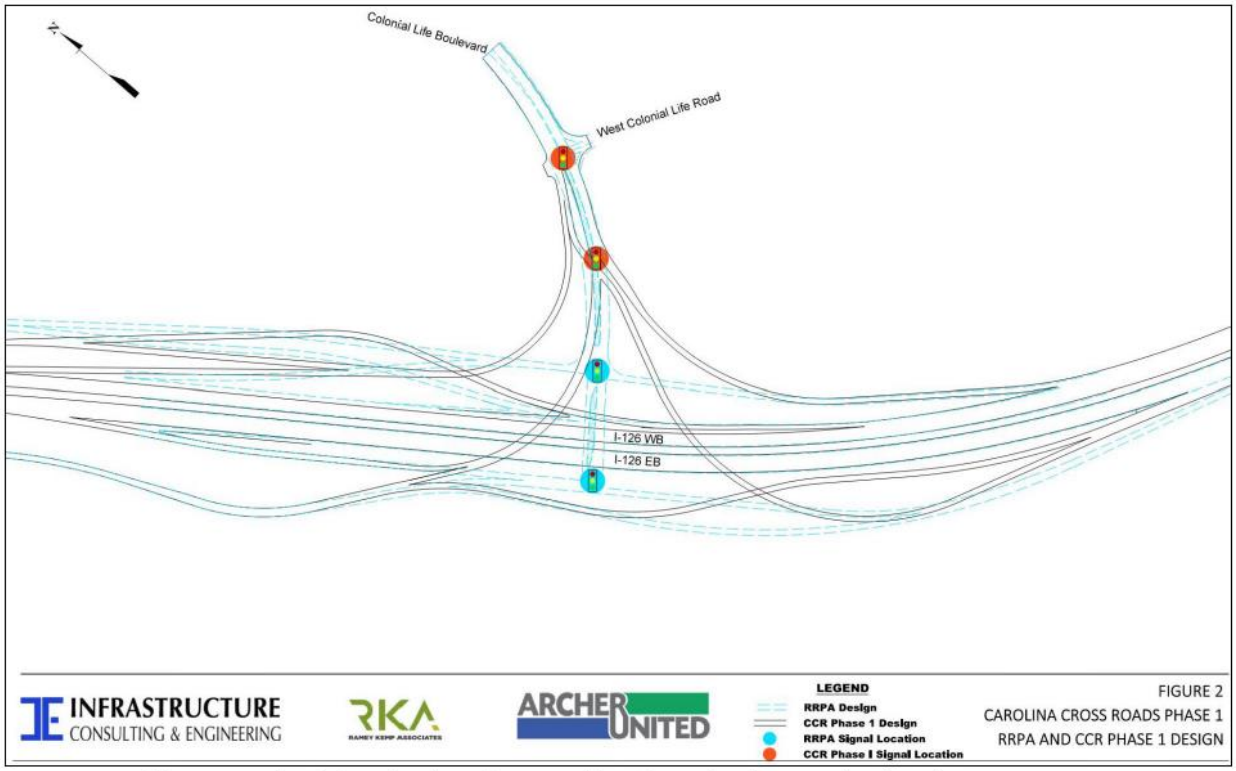
1.2 NEPA

A DEIS was completed in 2019, where the environmental impacts associated with the project were analyzed and documented. The FEIS and Record of Decision was issued by FHWA in May 2019. Subsequent design modifications since the completion of the 2019 Systems IMR were documented in NEPA Re-evaluations #1 and #5 are briefly discussed in this section, and approved documents are included in **Appendix A**:

1.2.1 NEPA Re-evaluation #1 - Colonial Life Boulevard (Phase I)

For this interchange, a full access tight urban diamond interchange was proposed in the 2019 Systems IMR. As part of the Phase 1 design build construction, an alternative design (partial diverging diamond interchange) (see **Figure 2**) concept was chosen as the most preferred concept based on several factors such as design innovation, constructability, cost effectiveness, and traffic operations.
This analysis was conducted using TransModeler version 4 to ensure that the proposed interchange design would not have significant impacts on the traffic operations and safety during AM and PM peak hours under current year (2020) and design year (2040) traffic conditions. The full traffic analysis including the interchange justification for this preferred alternative can be found in the September 2021 *Technical Memorandum I-126 at Colonial Life Boulevard Interchange – Traffic Analysis.* The changes to the Phase 1 design from the 2019 Systems IMR concept were included in the NEPA Re-evaluation #1, approved in August 2020.

Figure 2 - Phase 1 Preferred Concept for Colonial Life Boulevard Interchange

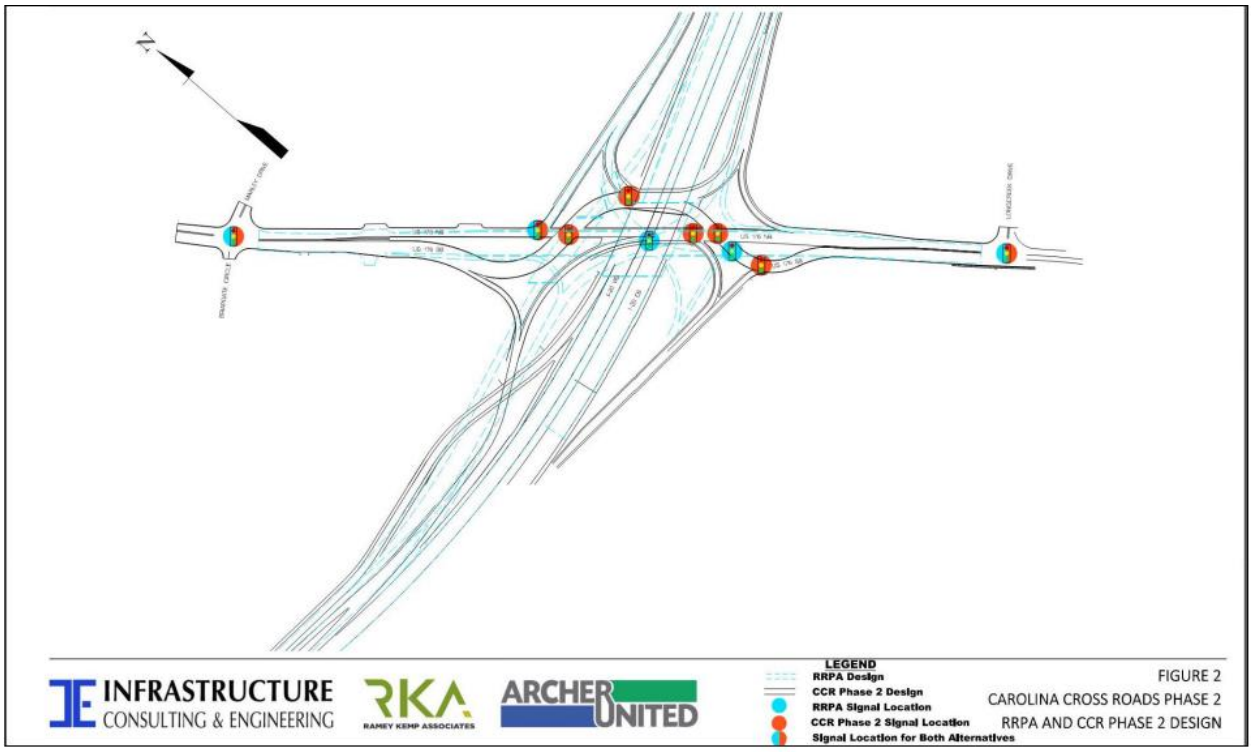


Source: Figure 2 of the *I-126 at Colonial Life Boulevard Interchange – Traffic Analysis Technical Memorandum (page 3)*

1.2.2 NEPA Re-evaluation # 5 – Broad River Road Technical Memorandum (Phase 2)

For the Broad River Road at I-20 (Exit 65) interchange, a single point urban interchange (SPUI) was proposed in the 2019 Systems IMR. As part of the Phase 2 design build construction, an alternative design Offset Diverging Diamond Interchange (DDI) concept (see **Figure 3**) was chosen as the most preferred concept based on several factors such as design innovation, constructability, cost effectiveness, and traffic operations. This design incorporates two new crossover intersections rather than a signal point intersection as proposed in the **Selected Alternative**. The analysis was conducted using TransModeler version 4 to ensure that the proposed interchange design would not have significant impacts on the traffic operations and safety during AM and PM peak hours under current year (2020) and design year (2040) traffic conditions. The full traffic analysis including the interchange justification for this preferred alternative can be found in the March 2022 *Technical Memorandum I-20 at Broad River Road Interchange – Traffic Analysis.* The changes to the Phase 2 design from the 2019 Systems IMR concept were included in the NEPA Re-evaluation #5 approved in September 2022.

Figure 3 - Phase 2 Preferred Concept for Broad River Road Interchange



Source: Figure 2 of the *I-20 at Broad River Road Interchange – Traffic Analysis Technical Memorandum (page 3)*

1.2.3 Modified Selected Alternative Phase 1/Phase 2 Traffic Technical Report (June 2022)

As the Carolina Crossroads Project has advanced through the initial construction phases, the design concept has been updated to accommodate refinements made during right-of-way acquisition throughout the entire limits of the Carolina Crossroads Project. The version of the design concept that includes all of these changes is referred to as the MSA.

Due to substantial updates to the 2040 SA network and to understand the impacts to the network at the completion of Phase 1 and 2 before Phase 3 was completed, a simulation-based, dynamic traffic assignment (DTA) was completed for the updated SA design in 2040 AM and PM scenarios using TransModeler version 4. The analysis results of the mainline density segments for the 2040 SA (referred to the 2040 Build RRPA as part of the approved IMR) and the 2040 MSA conditions were compared and summarized in June of 2022 *Technical Memorandum Modified Selected Alternative Phase1/Phase 2 Traffic Report.* This report also summarized the updated MSA network analyses including the final design concepts for Phase 1 and Phase 2 and an updated interchange concept at I-20 Exit 63 (Tie-in). MSA network analyses MOEs were compared against the approved Systems IMR to identify the impacts of Phase 1 and 2 improvements prior to the completion of improvements to the entire project area.

Appendix A includes previously approved documents, including the 2019 Systems IMR and the June 2022 *Technical Memorandum Modified Selected Alternative Phase 1/Phase 2 Traffic Report.*

Figure 4 - Exit 63 Bush River Road Existing Tie-In Concept

1.3 Purpose and Need

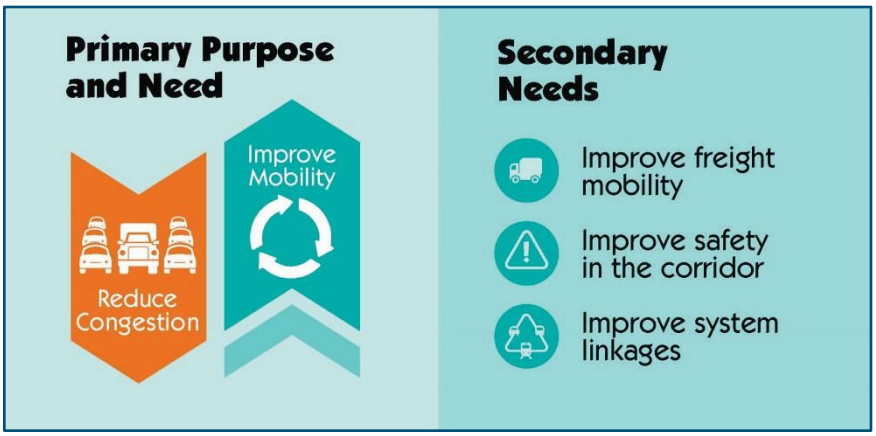
The primary purpose of a project is the driver of the project. It reflects the fundamental reason the project is being pursued. The secondary purpose (or other desirable outcome) is an additional purpose(s) that is desirable but not the core purpose of the project.

The primary purpose of the proposed Carolina Crossroads Project is to implement a transportation solution(s) that would improve mobility and enhance traffic operations by reducing existing traffic congestion within the I-20/26/126 corridor while accommodating future traffic needs.

The secondary purposes of the proposed Carolina Crossroads Project are to enhance safety throughout the corridor, improve freight mobility, and improve system linkages, while minimizing community and environmental impacts.

As interstates initially developed in the 1950s and 1960s and improved during the 1970s and 1980s, I-20, I-26, and I-126 do not meet current vehicular traffic demands. The study area experiences heavy traffic congestion due to increases in vehicular traffic, vehicle weaving, interchange spacing, above average crash rates, and access ramps to and from each interstate that consistently become congested.

Figure 5 – Purpose and Need



Finding an up-to-date solution has become a statewide priority. The need for this project is a result of the following factors:

- Growth in population and employment
- Decreased mobility and increased traffic congestion in the peak travel hours (inadequate roadway capacity)
- Increased user delay and lost productivity
- Safety concerns (increase in crash and fatality rates)
- Inadequate system linkages (lack of bicycle, pedestrian, and transit infrastructure)

1.4 Systems IMR Re-evaluation Reasons

There are four primary reasons necessitating the Re-evaluation of the approved Systems IMR. These are listed below.

1.4.1 Reason 1 – Change in the Design Year

The approved IMR and subsequent traffic analyses for Phase 1, Phase 2 and MSA have used Design Year 2040. The basis for 2040 projected traffic volumes was the 2040 South Carolina Statewide Model (SCSWM) and a 20-year design life of the project. The SCSWM is currently updated to Horizon Year 2050 and will be used to project traffic volumes for the Design Year 2050. Procurement challenges have resulted in the rephasing of the Project in 2024 which extends the Carolina Crossroads Project construction schedule and results in the I-20/I-26 system interchange construction phase planned to start in 2029. To evaluate the 20-year design life of the project, the design year has been revised to 2050.

1.4.2 Reason 2 – Design Changes

To obtain Safety, Operational & Engineering (SO&E) and NEPA approval for changes documented in the MSA and proposed design changes at the following interchanges:

- I-20 and I-26 System Interchange
- I-126 and I-26 System Interchange
- I-26 at St. Andrews Road
- I-20 at Bush River Road
- I-20/I-26 System Interchange collector-distributor system

- Colonial Life Boulevard at I-126
- Broad River Road at I-20

1.4.3 Reason 3 – Change in TransModeler Version

The TransModeler (Version 4.0 Build 6275) was used for the approved Systems IMR and subsequent traffic analysis for Phase 1, Phase 2 and MSA. The Highway Capacity Manual (HCM) methodologies have evolved from HCM 2010 since the Systems IMR approval to the latest HCM 7th edition. Similarly, the current TransModeler is version 7 which implements the latest HCM methodologies. This Re-evaluation will conduct traffic analysis using the latest TransModeler version 7.

1.4.4 Reason 4 – Change in Traffic Data

Traffic data for the existing and future traffic analyses for the approved Systems IMR was collected between 2014 and 2016 with the volume counts collected in 2015. Due to the age of the data reaching 10 years old, new data was collected in the Spring of 2024 as part of the re-evaluation. The new data was utilized for calibration and traffic forecasting to the new 2050 design year.

1.5 Request for Approval

Since the approval of the 2019 Systems IMR, the Carolina Crossroads Project has been separated into five construction phases and multiple subphases (see **Figure 6**).

Improvements to the I-126 at Colonial Life Boulevard interchange are now part of Phase 1 of the Carolina Crossroads Project Delivery, while the I-20 Exit 65 Interchange at Broad River Road is now part of Phase 2. Phases 1 and 2 are both under construction as design-build projects, and the construction is expected to be completed in 2025. Traffic Technical Memoranda addressing changes to the I-126 at Colonial Life Boulevard interchange and I-20 Exit 65 (Broad River Road) were approved as part of the Phase 1 and Phase 2 design-build projects, ID P039718 and ID P039719, respectively, and subsequent NEPA Re-evaluations #1 and #5, respectively.

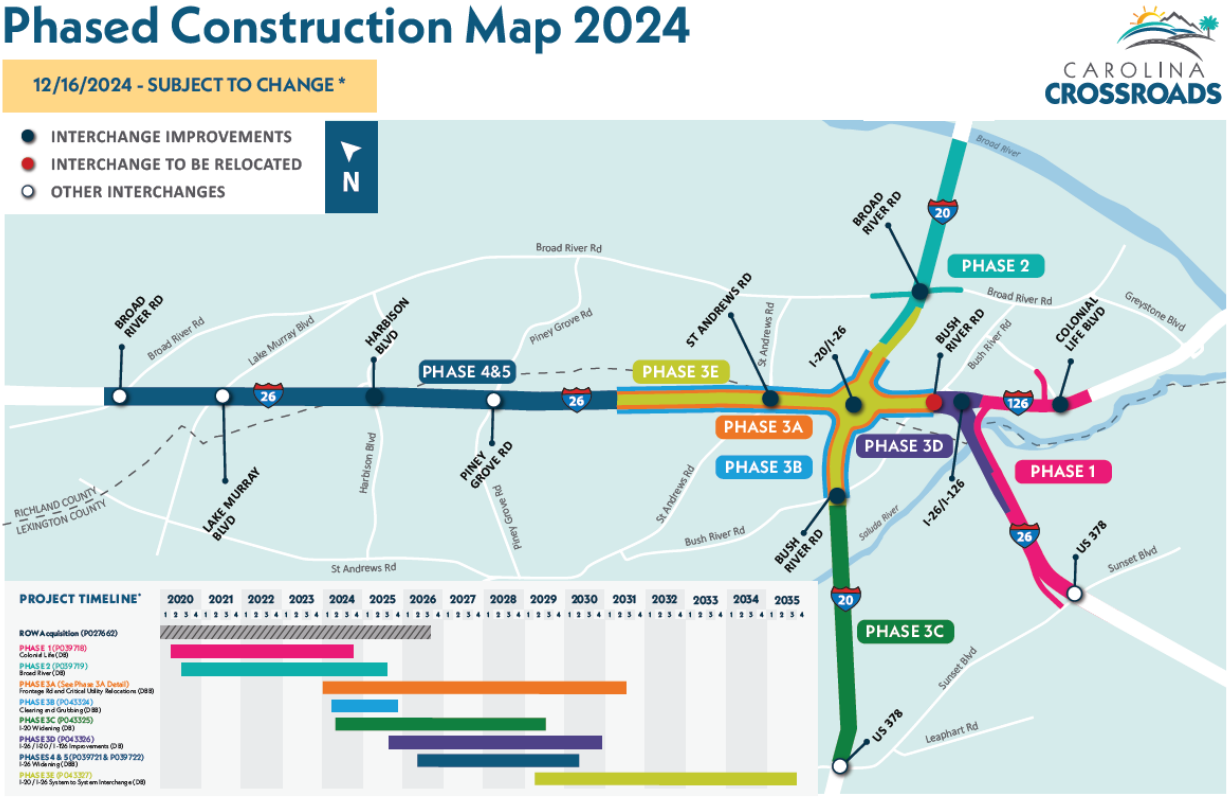
In the new phasing plan for Carolina Crossroads Project, Phase 3 has been divided into subphases—A, B, C, D, and E. With this submittal, the SCDOT is seeking approval of the updated designs of Carolina Crossroads Project Phases 1, 2, and 3 (shown as “IMR Re-evaluation Study Area in **Figure 1**) to support the NEPA re-evaluation studies.

1.6 The Applicant

The interchange policy is administered by the Federal Highway Administration (FHWA). Therefore, FHWA is required to approve all new access or changes in access points pursuant to this policy.

As the owner and operator of the Interstate System, SCDOT (the applicant) is responsible for submitting a formal request to the FHWA demonstrating traffic and safety analysis for the proposed changes in access, as well as the recommended action.

Figure 6 - Carolina Crossroads Project Phased Construction Map



2. Methodology

The analysis methodology is consistent with the FHWA Policy No. 98-3460 (Federal Register; February 11, 1998; Volume 63, Number 28) and procedures outlined in the FHWA Interchange Request Access Request. The methodology consistent with the previously approved 2019 Systems IMR methodology. The methodology was discussed and developed in coordination with SCDOT and FHWA. The approved Project Methodology Report is provided in **Appendix B**.

2.1 Study Area

The Systems IMR Re-evaluation Study area is the same as the approved Systems IMR as shown in **Figure 1**. The study area includes the following:

I-26 from Broad River Road to US 378 (approximately nine miles), including eight interchanges:

- I-26 at Broad River Road (US 176)
- I-26 at Lake Murray Boulevard (SC 60)
- I-26 at Harbison Boulevard
- I-26 at Piney Grove Road
- I-26 at St. Andrews Road
- I-26 at I-20
- I-26 at Bush River Road
- I-26 at I-126
- I-26 at Sunset Boulevard (US 378) -adjacent interchange analyzed to address FHWA requirements.

I-20 from east of US 378 to the Broad River (approximately five miles), including three interchanges:

- I-20 at Sunset Boulevard (US 378) -adjacent interchange analyzed to address FHWA requirements.
- I-20 at Bush River Road
- I-20 at Broad River Road

I-126 from I-26 to Grey Stone Boulevard (approximately two miles), including two interchanges:

- I-126 at Colonial Life Boulevard
- I-126 at Greystone Boulevard -adjacent interchange analyzed to address FHWA requirements.

The study area includes all ramp terminal intersections adjacent to the thirteen study interchanges along I-20, I-26, and I-126.

2.2 Analysis Years

The corridor is analyzed for the following years:

- Existing Year 2024. The existing year analysis was performed primarily for calibration purposes.
- Design Year 2050

The project alternatives were compared for the Design Year (2050).

2.3 Analysis Periods

Morning (AM) peak, and afternoon (PM) peak hour traffic conditions are evaluated within the study area to account for the significant directional flow of traffic in the respective peak hours.

2.4 Project Alternatives

The Systems IMR Re-evaluation assessed the following alternatives:

- Selected Alternative (SA) – The approved 2019 Systems IMR Concept.
- Build Alternative - The updated designs of the Carolina Crossroads Project Phases 1, 2, and 3.

2.5 Data Collection

Consistent with the approved Systems IMR, the following data was recollected in 2024:

- Turning Movement Counts: 24-hour turning movement counts including pedestrian and bike counts were collected for the study intersections and ramp terminal on April 25, 2024.
- Vehicle Classification Counts: Seven-day vehicle classification counts were collected from April 21 through April 27, 2024.
- The following data was obtained from SCDOT:
    - Road Inventory Data.
    - ATR data for all active stations within the study area for available days in 2023 and 2024.
    - Historic AADT from SCDOT from 1996 through 2023.
    - NPMRDS (National Performance Management Research Data Set) Regional Integrated Transportation Information System (RITIS) speed data.
    - 2024 StreetLight Origin-Destination (OD) data.
    - Crash data for the study area for three years, from January 01, 2021, to December 31, 2023.
    - Latest (2024) Traffic signal plans and coordinated signal timing plans.
    - Travel Demand Model (TDM): Regional TDM and SCSWM model files.
    - Desired Speed distribution data was obtained from National Highway Traffic Safety Administration (NHTSA).

The data collection is included in **Appendix C**.

2.6 Traffic forecasting

The traffic forecasting used for this Systems IMR Re-evaluation is consistent with the approved Systems IMR and general SCDOT traffic forecasting practices. Future year traffic volume forecasts were developed for AM and PM peak hours for project alternatives. The methodology includes reviewing the following information.

- Historic linear, compound and average annual ADT growth trends for 10, 20 and 30 years were calculated. The linear, compound and average rates were calculated as follows:
    - Linear Growth - a straight-line growth between analysis years.
    - Compound Growth - percentage of growth from the previous year
    - Average growth - mean growth over analysis years.

- Grow rates from SCSWM and Columbia Area Transportation Study (COATS) Regional Travel Demand Model
- Previous studies
- Population and employment growth trends were estimated for Lexington and Richland Counties.

2.7 Traffic Operational Analysis

The study area is evaluated using Caliper's microsimulation modeling software, TransModeler version 7 Build 10280. A peak hour model was developed for AM and PM conditions. An existing TransModeler model was calibrated to 2024 conditions per FHWA Traffic Analysis Toolbox Volume III: Guidelines for Applying Traffic Microsimulation Modeling Software (2019) calibration criteria.

The following microsimulation analyses were conducted for future conditions:

- Basic Freeway analysis
- Ramp merge, diverge, and weave analysis
- Intersection analysis

As described in the approved Project Methodology Report, the following measures of effectiveness (MOEs) from TransModeler were used to differentiate between the alternatives:

- Freeway, weave, and ramp merge/diverge: Density and LOS.
- Intersection: Intersection delay and intersection LOS

2.8 Safety Analysis

The safety analysis was conducted using the crash data from January 01, 2021, to December 31, 2023. A predictive safety analysis was conducted consistent with the Highway Safety Manual (HSM) using the Enhanced Interchange Safety Analysis Tool (ISATe) for project alternatives for 2050 conditions. It should be noted that the 2019 Systems IMR included safety analysis but not the HSM predictive analysis.

3. Existing Model Development and Calibration

The existing conditions simulation models for the study area were developed using Caliper's microsimulation modeling software, TransModeler version 7 Build 10280. TransModeler is a microscopic behavior-based multi-purpose traffic simulation program that takes into consideration vehicle interaction and driver behaviors, as well as the operational impacts for both the upstream and downstream traffic conditions and can measure traffic densities on each segment and lane. TransModeler tracks individual vehicle movements and interactions more realistically than typical HCM methods and quantifies the performance of individual movements and overall delays and queue lengths for freeways, ramps, and intersections. Model assumptions, parameters, and network coding techniques are discussed in the following subsections. All assumptions are based on the traffic conditions collected in the field in April 2024. Existing models represent the year 2024 conditions.

3.1 Data Inputs

Multiple data sources were used to develop the data inputs and calibration targets in the TransModeler models for the Carolina Crossroads Project. The TransModeler model data inputs, sources, and uses are shown in **Table** 1 below.

Table 1 - Model Data Inputs

Data	Source	Use
Traffic Volumes	HDR/SCDOT	Input and Calibration
Signal Timing	SCDOT	Input
Speed	NHTSA/RITIS	Input and Calibration
OD	StreetLight	Input

3.2 Model Geometries

The calibrated 2019 Systems IMR TransModeler (Version 4.0 Build 6275) files were used for existing model development. The TransModeler (Version 4.0 Build 6275) files were converted to TransModeler version 7 Build 10280. Aerial photography was utilized to develop the 2024 base TransModeler network and establish intersection lane configurations, stop bar locations, and turn pocket lengths. The high-resolution aerials were also used to accurately model merge, weave, diverge, and lane drop sections on I-20/I-26/I-126.

3.3 Vehicle Inputs

Balanced traffic volumes were summarized in 15-minute intervals using existing count data in order to represent the traffic fluctuations during simulated peak hours, which allowed the TransModeler models to represent traffic arrival patterns and queuing more closely on the freeway and at study intersections. The TransModeler models included a 60-minute seeding period before the peak hour. The seeding period allows for vehicles to be loaded into the network before recording simulation results. Due to congestion in the study area, particularly in the AM peak period, the shoulder hours allow congestion to build prior to the peak hour and control how long the congestion lasts or how quickly it subsides.

A global peak hour of 7:15 AM to 8:15 AM and 4:30 PM to 5:30 PM was determined for the study area based on traffic counts collected during April 2024. Based on existing count data, the traffic profiles for AM and PM peak hours are shown in **Figure 7**, and peak hour volumes are included in Appendix D.

Figure 7 - Peak Hour Traffic Flow Profile

Peak Hour	Traffic Flow Profile
AM	PM	
3.4 Traffic Composition

Traffic compositions (car and truck percentages) were derived from existing field measured count data. Traffic composition is a generalized classification utilized for high level differences of the analysis such as OD matrices. **Tables 2 and 3** summarize peak-hour truck percentages for I-20/I-26/I-126 and study intersections for AM and PM peak hours. The truck percentages and StreetLight OD data were used to estimate truck OD, and Auto and Truck matrices were created for AM and PM peak hours. The vehicular inputs included the following matrices:

- 2024_AM_Auto Trip Matrix
- 2024_AM_Auto Trip Warmup Matrix
- 2024_AM_Truck Trip Matrix
- 2024_AM_Truck Trip Warmup Matrix
- 2024_PM_Auto Trip Matrix
- 2024_PM_Auto Trip Warmup Matrix
- 2024_PM_Truck Trip Matrix
- 2024_PM_Truck Trip Warmup Matrix

3.5 Vehicle Fleet

Car and heavy vehicle distributions were based on the TransModeler's default vehicle fleet, derived from the U.S. Bureau of Transportation Statistics data representing the U.S. vehicle fleet in 2019. Classifications are, in part, based on wheelbase using a methodology developed by FHWA. The model distribution for cars and trucks is shown in **Table 4**. Vehicle fleet data is a simulation parameter that influences vehicle dimensions and performance in the simulations which has a small impact on operations.

Table 4 - Vehicle Fleet Distributions

Description	Percentage
High Performance Passenger Cars	31%
Middle Performance Passenger Cars	36%
Low Performance Passenger Cars	21%
Pickup Trucks, Vans, and SUV's	10%
Motorcycles	1%
Single-Unit Trucks	<1%
Trailer Trucks	<1%
Buses	<1%
Articulated Transit Buses	<1%

3.6 Vehicle Routing

Traffic patterns in TransModeler were modeled using OD matrices. The OD matrices were developed to achieve vehicle routing through the study area, where multiple intersections exist. The OD matrices were estimated using StreetLight OD as a seed matrix in Visum. The OD matrices were developed based on peak-hour volumes. The traffic patterns were created for cars and trucks separately.

3.7 Desired Speed Distributions

Default TransModeler National Highway Traffic Safety Administration (NHTSA) Desired Speed distribution profiles were used for the freeways and arterials and modified based on RITIS data for freeway 70 mph segments. The desired speed distributions used for the study are shown in **Table 5**.

Table 5 - Desired Speed Distributions

Deviation from Speed Limit (mph)	Driver Population (%)		
	Arterial/ Standard	Freeway (60 mph/55 mph)	Freeway (70 mph)
-10	2	1	5
-5	5	4	10
0	15	25	70
5	25	30	11
10	25	20	3
15	15	15	1
20	10	4	0
25	3	1	0

3.8 Signal Operations and Stop Control

The latest signal timing and phasing, obtained from current SCDOT signal plans, were used in the TransModeler for the AM and PM peak hours.

3.9 Number of Model Runs

Due to the varying nature of the simulations between runs with different random seed numbers, TransModeler results can differ from one run to the next. Multiple runs are required to improve model accuracy, and the results should be calculated using an average of these runs. Ten (10) runs were performed for the existing conditions models, with random seed numbers ranging from 5 to 50 with increments of 5.

3.10 Model Calibration

Calibration is an iterative process that involves adjusting model parameters until the simulation reasonably replicates driver behavior, traffic flow patterns, and field-measured data. The calibration process used for the TransModeler models followed FHWA guidelines for determining the acceptability of model results compared to existing operations. The following subsections discuss a synopsis of the calibration process, with emphasis on identifying the key decisions and assumptions made in the refinement process to achieve the calibration targets.

3.10.1 Visual Checking and Error Correction

The visual checking and error correction process focused on addressing coding errors before the calibration process began. This process involved reviewing data inputs, TransModeler error reports, and model animations. Although primarily performed during model development, visual checking and error

correction is still an important process that should be performed during calibration. When making changes to driver behavior or other model parameters, this step helps ensure that unintended consequences are minimized in the model.

Data inputs included network geometry, traffic volumes, signal timing, and route choices, and were reviewed by the model developer as well as a quality control reviewer. The animation was visually checked for abnormal driving behavior or irregular queuing within the network and to identify coding parameters subject to additional refinement.

3.10.2 Calibration Targets

The objective of model calibration is to match model performance estimates and the field performance measurements. However, there is a limit to the accuracy that results from an extensive process of matching the model to the field conditions, since observations on different days will naturally yield different results due to normal fluctuations in traffic patterns. The following calibration targets were used based on the *FHWA Traffic Analysis Toolbox*:

1. Hourly Flows (Model Versus Observed)
    a. Simulated and measured link volumes for more than 85% of links to be:
        I. Within 100 vehicles per hour (vph) for volumes less than 700 vph
        II. Within 15% for volumes between 700 vph and 2700 vph
        III. Within 400 vph, for volumes greater than 2700 vph
    b. Simulated and measured link volumes for more than 85% of links to have a GEH statistic value of five (5) or lower.
    c. Sum of link volumes within calibration area to be within 5%.
2. Visual Audits
    a. Check consistency with field conditions of the following: on- and off-Ramp queuing; weaving maneuvers; patterns and extent of queue at intersections and congested links; lane utilization/choice; location of bottlenecks; etc.
    b. Critical queue lengths are visually acceptable to the satisfaction of analysts and reviewers.

3.10.3 Volume Validation

The GEH statistic used for traffic volume calibration compares expected or measured volumes with volume output from the microsimulation model and is calculated using the following formula:

$$GEH = \sqrt{\frac{2(m-c)^2}{m+c}}$$

Notes:
m = output traffic volume from the simulation model (vph)
c = input traffic volume (vph)

The GEH is scored using the following classification:

GEH < 5.0	**Acceptable fit**
5.0 <= GEH <= 10.0	Caution: possible model error or bad data
GEH > 10.0	Unacceptable

Using GEH instead of difference percentages allows for better acceptance over a wider range of volumes. GEH is not linear and places less importance on links with low expected volumes while allowing for variation at high-volume locations. GEH values higher than 5 should warrant investigation, and values over 10 indicate there may be an error with the model.

3.10.4 Speed Validation

SCDOT provided speed data on I-20/I-26/I-126 from the Regional Integrated Transportation Information System (RITIS), which maintains all detector data. Speed data is primarily used to develop speed contours for the calibration of known bottlenecks and other congested areas.

3.10.5 Global Parameters

The default saturation flow rate of 2400 passenger car equivalent (PCE) per hour per lane was updated to 1900 PCE per hour per lane to account for local characteristics in the area for all Road Classes in the model. The Wiedemann 99 and Wiedemann 74 car following models were used for freeway and arterials roadways, respectively.

3.10.6 Localized Calibration Parameters

To account for lane changing near the merge areas along the freeway, a Parameter Marker was used to place local Wiedemann 99 car following behavior to allow for better vehicle gaps to merge. The car following model parameters CC0 (standstill Distance) and CC1 (Headway Time) were modified from national guidance including the 2021 Florida Department of Transportation Traffic Analysis Handbook and 2024 Ohio Department of Transportation Analysis and Traffic Simulation Manual. The Wiedemann 99 car following local parameters were modified from the default values based on the above-referenced national guidance documents.

3.11 Calibration Results

The results of the TransModeler calibration process were used to validate traffic volumes and speeds and discussed in the following subsections:

3.11.1 Speed Validation

Travel speeds on the I-20/I-26/I-126 corridors from RITIS are compared to the model speeds for both AM and PM. Based on the RITIS data, the extent and duration of congestion are higher in the AM peak hour than in the PM peak hour for the I-20/I-26/I-126 corridors. The AM peak hour congestion is extended over

longer segments of I-26 eastbound and I-20 eastbound, while the PM peak hour congestion is localized for a shorter segment of I-26 westbound and I-126 westbound. Hence, the freeway calibration was primarily focused on the AM peak hour. **Figure 8** summarizes the calibration results, closely matching the RITIS data. The AM peak hour calibration parameters were applied to the PM peak hour.

3.11.2 Traffic Volume Validation

Table 6 provides a validation summary based on individual link flows for simulated traffic volumes and balance field-collected volumes for the freeway and at each intersection. **Table 7** summarizes the criteria for the total volume (sum of all turning movements) in the study area. Overall, **Table 6** indicates that 99 % of links in the AM peak hour and 96% of links in the PM meet the individual flow and GEH FHWA volume validation criteria guidelines.

Table 6 - Volume Validation Summary for Individual Link Flows

Hourly Flows - Model v. Observed	Target	AM Peak Hour			PM Peak Hour		
		Total Links	Links Meeting Target	% Links Meeting Target	Total Links	Links Meeting Target	% Links Meeting Target
Individual Link Flows							
Within 100 vph for flows < 700 vph	> 85%	176	175	99%	170	168	99%
Within 15% for 700 vph < flow < 2700 vph	> 85%	36	36	100%	40	37	93%
Within 400 vph for flows > 2700 vph	> 85%	26	26	100%	28	24	86%
All Links	> 85%	238	237	100%	238	229	96%
GEH Criteria							
All Links	> 85%	238	235	99%	238	225	95%

Table 7 summarizes the FHWA volume validation guidelines for total simulated volumes to be within 5% of observed volumes. The results show 3.5% and 4.3 % for AM and PM peak hours, respectively. Both AM and PM simulated volumes do not significantly differ from the observed volumes in the field.

Table 7 - Volume Validation Summary for Total Volumes

Hourly Flows - Model v. Observed	Target	AM Peak Hour			PM Peak Hour		
		Counts (vph)	Model (vph)	% Meets	Counts (vph)	Model (vph)	% Meets
Sum of Link Flows	<5%	188225	181620	3.5%	200460	191807	4.3%

4. Future Traffic Forecasts

The approved 2019 Systems IMR and subsequent traffic analyses for Phase 1, Phase 2 and MSA have used Design Year 2040. The basis for 2040 projected traffic volumes was the 2040 South Carolina Statewide Model (SCSWM) and a 20-year design life of the project. The SCSWM is currently updated to Horizon Year 2050 and was used to project traffic volumes for the Design Year 2050. This section discusses the development of traffic forecasts used in 2050 future-year operational analyses. To develop future volume forecasts for future-year analysis, growth rates from historical data, population-based growth rates, and model-based growth rates from SCSWM and Regional Travel Demand Models were reviewed. In addition, the justification of the growth rate utilized in the 2019 IMR was reviewed and compared to growth patterns since the 2015 traffic data and rate were developed.

4.1 Historical Growth Rates

The SCDOT Trends Analysis spreadsheet was used to calculate traffic growth trends for the study roadways for 10, 20, and 30 years. **Table 8** summarizes the annual linear, compound and average growth rates for the SCDOT count sites, and the analysis outputs for each count station are included in **Appendix E**.

The trends growth rate also reviewed the growth rate since the completion of the 2019 IMR, which included existing traffic counts from 2015.

4.2 Model Growth Rates

The growth rates from the two travel demand models in SCSWM and Columbia Area Transportation Study (COATS) regional travel demand model were calculated. The latest models were obtained from SCDOT.

The SCSWM includes the entirety of South Carolina and is built upon existing travel demand models from the Metropolitan Planning Organizations (MPO) and the Council of Governments (COG) within the state. It has a base year of 2019 and a horizon year of 2050. Similarly, the COATS regional travel demand model has a base year of 2018 and a horizon year of 2045. The statewide (SCSWM) and regional travel demand model (COATS) include existing roadways and committed projects, including all planned and programmed improvements in the study area. Traffic volumes were extracted from SCSWM and COATS for the base year and horizon years, and growth rates were calculated for the study area. **Table 8** summarizes the annual growth rates for SCSWM and COATS.

4.3 2019 IMR Growth Rates

The 2019 Systems IMR utilized a 0.7 percent annual growth rate across the project study area to estimate 2040 peak hour traffic volumes. In addition to considering historical growth rates and regional demographic patterns, this growth rate was referenced from a I-20/26/77 Corridor Management Plan (CMP) by the COATS MPO which was a regional forecasting effort based on 2015 count data, coordination with the SCSWM, and a Transmodeler network of the Columbia metro area which included the CCR study area. OD data collected as part of the Carolina Crossroads Project data collection and developed into regional trip tables was then used in the microsimulation model.

Table 8 – Annual Historic and Model Volume Growth Rates

Road Name	Location	Historical Data									Model Annual Growth Rates		Trend Analysis Annual Growth Rate (Linear) *2015-2023

4.4 Recommended Growth Rate and Design Year Peak Hour Volumes

Based on the growth rate study, it was recommended in coordination with SCDOT to maintain the 2019 IMR annual growth of 0.7 percent for the study area. While historic growth rates in the study area varied by time period and location, the growth rates since the 2015 data collection for the IMR and the CMP effort did not support the need to change the 0.7 percent rate. In addition, it would not be appropriate for this IMR Re-evaluation to replicate the CMP forecasting effort to update the detailed growth rate analyses. The 0.7 percent annual growth rate was applied to 2024 peak hour volumes to obtain 2050 peak hour volumes. The peak hour volumes are included in **Appendix E**.

5. Future Conditions Alternatives

The project evaluates the following:

1. Selected Alternative (SA) – The approved 2019 Systems IMR Concept.
2. Build Alternative - The updated designs of the Carolina Crossroads Project Phases 1, 2, and 3.

The Selected Alternative design concept has been updated to accommodate design refinements made since 2019 from multiple project phases' design build procurements and project efforts throughout the entire limits of the Carolina Crossroads Project. The design modifications between the Selected Alternative and the Build Alternative configurations are shown in **Figures 9 through 27** and briefly listed below:

- Bush River Road at I-20 (Exit 63) interchange was changed from a Diverging Diamond interchange (**Figure 9)** in the Selected Alternative to the existing partial clover interchange (**Figure 10**) in the Build Alternative. Change resulting from additional interchange alternative analyses to reduce right-of-way impacts, improve constructability and reduce scope of work at interchange and was included in a Phase 3 design build alternative technical concept (ATC). Analyses included in NEPA Re-evaluation #6.
- St. Andrews Road (Exit 106) interchange changed from a single-point urban interchange (**Figure 11**) in the Selected Alternative to an improved partial clover interchange (**Figure 12**) in the Build Alternative. Change resulting from Phase 3 design build alternative technical concept (ATC).
- I-20 and I-26 system-to-system (Exit 64/107) interchange in the Selected Alternative changed from a Turbine interchange configuration (**Figure 13**) to an interchange with dual loops (**Figure 14**) in the Build Alternative. Change resulting from Phase 3 design build alternative technical concept (ATC).
- The I-126 and I-26 (Exit 108) interchange maintained the Selected Alternative with a major modification to the I-126 westbound to I-26 eastbound ramp. This ramp changed from a flyover (**Figure 15**) in the Selected Alternative to a semi-directional ramp in the Build Alternative that crosses I-26 1700' to the west of the Selected Alternative (**Figure 16**). Change resulting from Phase 3 design build alternative technical concept (ATC) and included in NEPA Re-evaluation #6.
- The Colonial Life Boulevard at I-126 interchange changed from a tight diamond (**Figure 17**) in the Selected Alternative to a trumpet-style interchange with a crossover intersection on Colonial Life Boulevard **(Figure 18)** in the Build Alternative. Change resulting from Phase 1 design build alternative technical concept (ATC) and included in NEPA Re-evaluation #1.
- The I-20 at Broad River Road (Exit 65) interchange changed from a single-point urban interchange (**Figure 19**) in the Selected Alternative to an offset-diverging diamond interchange (**Figure 20**) in the Build Alternative. Change resulting from Phase 2 design build alternative technical concept (ATC) and included in NEPA Re-evaluation #5.
- A collector and distributor (CD) road was added in the Selected Alternative for I-26 (**Figures 21 & 22**) in the eastbound direction from west of St. Andrews Road to west of US 378 in the Build Alternative (**Figures 21 & 23**). Change resulting from Phase 3 design build alternative technical concept (ATC).
- The fourth westbound lane on I-20, which dropped before US 378 (**Figure 24)** in the Selected Alternative, has been extended approximately 4000' to the US 378 offramp and drops as an exit only (**Figure 25**) in the Build Alternative. Change to improve operations and better accommodate 2050 design year traffic.

- The four I-26 mainline lanes between the I-126 diverge and the C-D road eastbound merge (**Figure 26**) was changed to three mainline lanes (**Figure 27**). Change resulting from Phase 3 design build alternative technical concept (ATC).

The NEPA Re-evaluation #1, #5, and #6 are included in **Appendix A**.

6. Future Traffic Operation Analysis

Detailed operational analyses were performed using TransModeler 7.0 for project alternatives for the AM and PM peak hours in the design year (2050). A TransModeler microsimulation model consists of a large component database and executable files that are run through the TransModeler software. One single project file is comprised of network files, traffic control and signal timing plans, vehicle detector layout and configuration, trip tables for both autos and trucks, traffic volumes, and driver/roadway parameter files.

TransModeler is a microscopic behavior-based multi-purpose traffic simulation program that takes into consideration vehicle interaction and driver behaviors, as well as the operational impacts for both the upstream and downstream traffic conditions and can measure traffic densities on each segment and lane. For these reasons, TransModeler was used to assess all the freeway segments, merge/diverge areas, weaving sections and intersections.

The design files for project alternatives were converted to .KMZ files and imported as background into the TransModeler microsimulation network. After updating the geometry to match the design of the project alternatives, intersection controls were added for the new geometry. Synchro was utilized to develop basic traffic signal timing plans at the signal-controlled intersections.

The OD matrices were developed for vehicle routing throughout the study area. The OD matrices estimated in the existing calibration were used as a seed matrix in Visum. The OD matrices for project alternatives were developed for 2050 AM and PM peak-hour volumes. The OD matrices were created for cars and trucks separately.

To assess the traffic operations of the study area, the basic freeway segment, weave, ramp merge/diverge, and intersection area analyses were conducted.

6.1 LOS Criteria

The basic freeway, merge and diverge segments, and weaving segment LOS is based on density – a function of flow rate (volumes) and travel speed – for uninterrupted flow facilities. Density is measured in passenger cars per mile per lane (pcpmpl). The HCM 7th Edition LOS and density targets for uninterrupted facilities are listed in **Table 9**.

Table 9 - LOS Criteria for Uninterrupted Flow Facilities

LOS	Basic Freeway	Merge and Diverge	Weaving
A	≤ 11	≤ 10	0-10
B	> 11-18	> 10-20	> 10-20
C	> 18-26	> 20-28	> 20-28
D	> 26-35	> 28-35	> 28-35
E	> 35-45	> 35	> 35
F	> 45	Demand Exceeds Capacity	Demand Exceeds Capacity

*Based on *Highway Capacity Manual (HCM) 7th Edition* Exhibit 12-15, Exhibit 13-6 and Exhibit 14-3

For intersection analysis, the peak hour LOS measures the adequacy of the intersection geometrics and traffic controls of an intersection or approach for the given turning volumes. LOS range from A through F, based on the average control delay experienced by vehicles traveling through the intersection during the

peak hour. Control delay represents the portion of total delay attributed to traffic control devices (e.g., signals or stop signs). **Table 10** shows LOS criteria by control type.

Table 10 - LOS Criteria for Interrupted Flow Facilities

LOS	Signalized Intersections (s)	Unsignalized Intersections (s)
A	≤ 10	≤ 10
B	> 10-20	> 10-15
C	> 20-35	> 15-25
D	> 35-55	> 25-35
E	> 55-80	> 35-50
F	> 80, and/or v/c > 1.00	> 80, and/or v/c > 1.00

*Based on *Highway Capacity Manual (HCM) 7th Edition* Exhibits 19-8 and 19-20

6.2 Network Performance

A network performance evaluation is an important statistic as it provides overall performance for the study area. As shown in **Table 11**, the Build Alternative provides better network performance than the Selected Alternative in the Design Year (2050). Each of the performance metrics, such as average speed, travel time, and total delay, is better in the Build than in the Selected Alternative.

Table 11 - Network Performance Summary

Peak Hour	Selected Alternative			Build Alternative			Percent Improvement		
	Speed (mph)	Average Travel Time (mins/veh)	Total Delay (vehicle hr)	Speed (mph)	Average Travel Time (mins/veh)	Total Delay (vehicle hr)	Speed	Travel Time	Total Delay
AM	48.0	7.6	1,768	50.1	6.5	1,229	4.4%	13.9%	30.5%
PM	48.0	7.2	1,723	51.5	6.1	969	7.3%	15.8%	43.8%

6.3 I-26 Freeway Analysis Results

Freeway densities for the freeway corridors were obtained from the TransModeler output files, which included an average of ten (10) replicate runs. HCM methodology is applied and averaged across segments to represent average density and LOS for freeway segments consisting of basic freeway, weaving and ramp merge/diverge.

The Design Year (2050) analysis results for the Selected Alternative and Build Alternative conditions on I-26 are summarized in **Tables 12**. The results indicate the following:

- **Selected Alternative**
  - I-26 westbound segment from Leaphart Road to Sunset Boulevard is expected to operate at an average of LOS D during the AM peak hour.
  - I-26 westbound off-ramp at Sunset Blvd is expected to operate at an average of LOS E during the AM peak hour.

- All other I-26 eastbound and westbound segments are expected to operate at an average of LOS C or better during the AM and PM peak hours.

- **Build Alternative**
  - All I-26 eastbound and westbound segments are expected to operate at an average of LOS C or better during the AM and PM peak hours.

6.4 I-20 Freeway Analysis Results

The Design Year (2050) analysis results for the Selected Alternative and Build Alternative conditions on I-20 for basic freeway, weaving and ramp merge/diverge segments are summarized in **Table 13**. The results indicate the following:

- **Selected Alternative**
  - I-20 eastbound segments from Augusta Road to Sunset Boulevard, Sunset Blvd off-ramp and Sunset Blvd on-ramp (loop) are expected to operate at an average of LOS D during the AM peak hour.
  - I-20 westbound segments from Bush River Road to Sunset Boulevard, Sunset Blvd off-ramp and basic segment between ramps at Sunset Blvd Interchange are expected to operate at an average of LOS E during the AM peak hour.
  - All other I-20 eastbound and westbound segments are expected to operate at an average of LOS C or better during the AM and PM peak hours.
- **Build Alternative**
  - I-20 eastbound segments from Augusta Road to Sunset Boulevard and Sunset Blvd off-ramp are expected to operate at an average of LOS D during the AM peak hour.
  - I-20 eastbound segments from Broad River Road to Broad River Bridge are expected to operate at an average of LOS D during the PM peak hour.
  - I-20 westbound segment from Bush River Rd to Sunset Blvd is expected to operate at an average of LOS D during the PM peak hour.
  - All other I-20 eastbound and westbound segments are expected to operate at an average of LOS C or better during the AM and PM peak hours.

6.5 I-126 Freeway Analysis Results

The Design Year (2050) analysis results for the Selected Alternative and Build Alternative conditions on I-126 for basic freeway, weaving and ramp merge/diverge segments are summarized in **Table 14**. The results indicate the following:

- Selected Alternative and Build Alternative
  - All westbound and eastbound segments along the I-126 corridor are expected to operate at an average of LOS C or better during AM and PM peak hours.

Table 14 - Design Year (2050) Traffic Operation Analysis Results for I-126

6.6 Intersection Operations Results

Capacity analyses for the signalized and unsignalized intersections at the study interchanges were performed using TransModeler software. The signalized and unsignalized intersection analyses were obtained from the TransModeler microsimulation output files, which include an average delay of ten (10) runs. For unsignalized intersections, the intersection operation is represented by the worst approach delay and LOS of all of the STOP-controlled approaches to the intersection. TransModeler measures control delay in accordance with HCM methodology and considers vehicles as soon as they begin to brake to join the back of a queue forming at an intersection until it has passed through the intersection and returned to speed.

Table 15 shows the comparison results of the capacity analyses for the Selected Alternative and Build Alternative for 2050 conditions. **Appendix F** includes the average control delay for each movement. The results indicate that the Build Alternative intersections are operating better than the Selected Alternative intersections.

Table 15 – Design Year (2050) Intersection Operational Results

Intersection	Control Type	Selected Alternative				Build Alternative			
		Delay		LOS		Delay		LOS	
		AM	PM	AM	PM	AM	PM	AM	PM

*The worst performing movement LOS is reported for unsignalized intersections.

7. Safety Analysis

A design year (2050) predictive crash assessment of the Selected and Build Alternatives was conducted using the FHWA Interchange Safety Analysis Tool Enhanced (ISATe) tool. Several assumptions were made to accommodate available information and/or limitations within the predictive crash analysis methodology.

- Calibration factors were not altered during analysis. Therefore, the resulting crash predictions and severity distributions are considered relevant by comparison in a relative manner only.
- Several interchange designs consist of non-traditional intersection designs, such as Single Point Urban Interchanges and Diverging Diamond Interchanges. Limitations within the crash predictive methodology preclude the analysis of such innovative interchange types. Therefore, only freeway mainlines, and ramp segments were included in the ISATe tool.
- The projected Average Annual Daily Traffic (AADT) has been used in the predictive crash analysis methodology.

7.1 Approved Systems IMR/SA Concept Configuration Results

A summary of the crash severity and total crashes for various sections of the study area under the Selected Alternative is shown below in **Table 16**. Severity is represented with KABCO designation.

- K - Fatal crash
- A - Incapacitating injury crash
- B - Non-incapacitating injury crash
- C - Possible injury crash
- O - Property Damage Only (PDO)

Table 16 – Selected Alternative (2050) Predictive Crash Summary

Segment	K	A	B	C	PDO	Total	Freeway Miles	Crashes /Mile
I-26/I-126								
I-26 Mainline	0.8	2.0	11.5	21.4	88.9	124.4	4.34	28.7
I-126 Mainline	0.1	0.4	2.1	3.7	15.2	21.5	1.05	20.5
EB Ramps	0.6	1.8	9.5	22.5	28.9	63.2	5.47	11.6
WB Ramps	0.2	0.5	2.8	5.8	17.5	26.7	5.78	4.6
I-20								
I-20 Mainline	0.7	2.0	11.3	20.5	87.4	121.9	4.97	24.5
EB Ramps	0.2	0.7	3.6	7.9	19.0	31.4	4.16	7.5
WB Ramps	0.2	0.5	2.8	6.0	15.8	25.3	4.09	6.2
Total System								
Total	2.8	7.9	43.6	87.8	272.7	414.4	29.86	-
Crashes/Mile	**0.09**	**0.26**	**1.46**	**2.94**	**9.13**	**13.88**	-	-

The two most dominant characteristics with respect to crash prediction are AADT and number of lanes. As expected, the mainline sections of the configuration experience the highest overall crash rates. This is due to the volume of daily traffic, relative to the volume on the ramp systems. Crash rates on I-26 and I-

20 are comparable due to similar AADT while crash rates per lane-mile on I-126 are lower, correlating to a lower overall AADT between downtown Columbia and the I-26/I-126 system-to-system interchange.

Crashes per lane-mile on the westbound collector-distributor system are lower than the eastbound system along I-26 and I-126 primarily due to the presence of fewer weaving sections in the westbound direction, lower overall AADT and less complicated merging and diverging segments.

7.2 Build Alternative Configuration Results

The Build Alternative configuration is the design update in 2024 and is compared to the Approved System IMR/SA Concept configuration within the IMR. A summary of the crash severity and total crashes for various sections of the study area under the Build alternative is shown in **Table 17**. Severity is represented with KABCO designation.

Table 17 - Build Alternative (2050) Predictive Crash Summary

Segment	K	A	B	C	PDO	Total	Freeway Miles	Crashes/ Mile
I-26/I-126								
I-26 Mainline	0.8	1.9	11.3	21.5	89.1	124.4	4.34	28.6
I-126 Mainline	0.2	0.4	2.2	3.8	15.6	22.2	1.08	20.6
EB Ramps	0.6	1.9	10.4	26.1	35.4	74.4	6.06	12.3
WB Ramps	0.2	0.5	2.8	6.6	20.6	30.7	6.29	4.9
I-20								
I-20 Mainline	0.7	1.8	9.5	16.4	68.7	97.1	4.97	19.5
EB Ramps	0.2	0.7	3.9	8.4	18.4	31.6	4.14	7.6
WB Ramps	0.1	0.5	2.6	5.5	14.8	23.5	3.82	6.2
Total System								
Total	2.8	7.7	42.7	88.3	262.6	403.9	30.71	-
Crashes/Mile	**0.09**	**0.25**	**1.39**	**2.88**	**8.55**	**13.16**	**-**	**-**

With respect to the Build Alternative, the crash rate along I-26 is higher than the rate along I-126 or I-20. The reason for this is that the AADT on I-26 is higher than that of I-20 or I-126. The eastbound ramp system has a higher crash rate than the westbound ramp system, primarily due to two reasons. The AADT on the ramp system in the eastbound direction is comprised of several collector-distributor sections carrying traffic from St. Andrews Road merging with traffic from I-26 bound for I-20 and carrying traffic from I-20 weaving with traffic from I-26 bound for I-126. The eastbound ramp and collector-distributor system is more complex than the westbound direction and has more merge and diverge sections. Both of these factors (AADT and merge/diverge/weave complexity) yield higher crash rates along the eastbound side of the ramp and collector-distributor system.

7.3 Configuration Comparison Summary

Overall, when comparing the Selected Alternative and the Build Alternative configurations, some systemwide similarities are seen. The predicted crash rates per mile on the I-26 and I-126 mainline is similar. On I-20, the Build Alternative Configuration consists of a fourth westbound lane between Bush River Road and US 378, which improves the crash rate over the Selected Alternative.

On the ramp systems, the crash rates along I-20 are very similar in both project alternatives. For the I-26/I-126 mainline ramp system, the westbound direction remains similar across both configurations; however, the eastbound system is more complex in the Build Alternative, which leads to a slightly higher crash rate on the eastbound direction when compared to the Selected Alternative. While certain segments of each configuration are higher or lower depending on the configuration, the overall crash rate is lower under the Build Alternative at 13.16 crashes per mile compared to 13.88 crashes per mile with the Selected Alternative. The number of estimated fatal crashes is comparable for both project alternatives, and trends lower for all other crash severity types with the Build Alternative. **Table 18** summarizes the crash rate for each configuration, by severity under 2050 AADT conditions.

Table 18 - Design Year (2050) Crash Rate (Crashes per Mile) Comparison

Crash Severity	Selected Alternative	Build Alternative	Percent Improvement
K - Fatal crash	0.09	0.09	0%
A - Incapacitating injury crash	0.26	0.25	4%
B - Non-Incapacitating injury crash	1.46	1.39	5%
C - Possible injury crash	2.94	2.88	2%
O - Property Damage Only	9.13	8.55	6%
Total	**13.88**	**13.16**	5%

ISATe output sheets for both alternatives are included in **Appendix G**.

8. Other Considerations

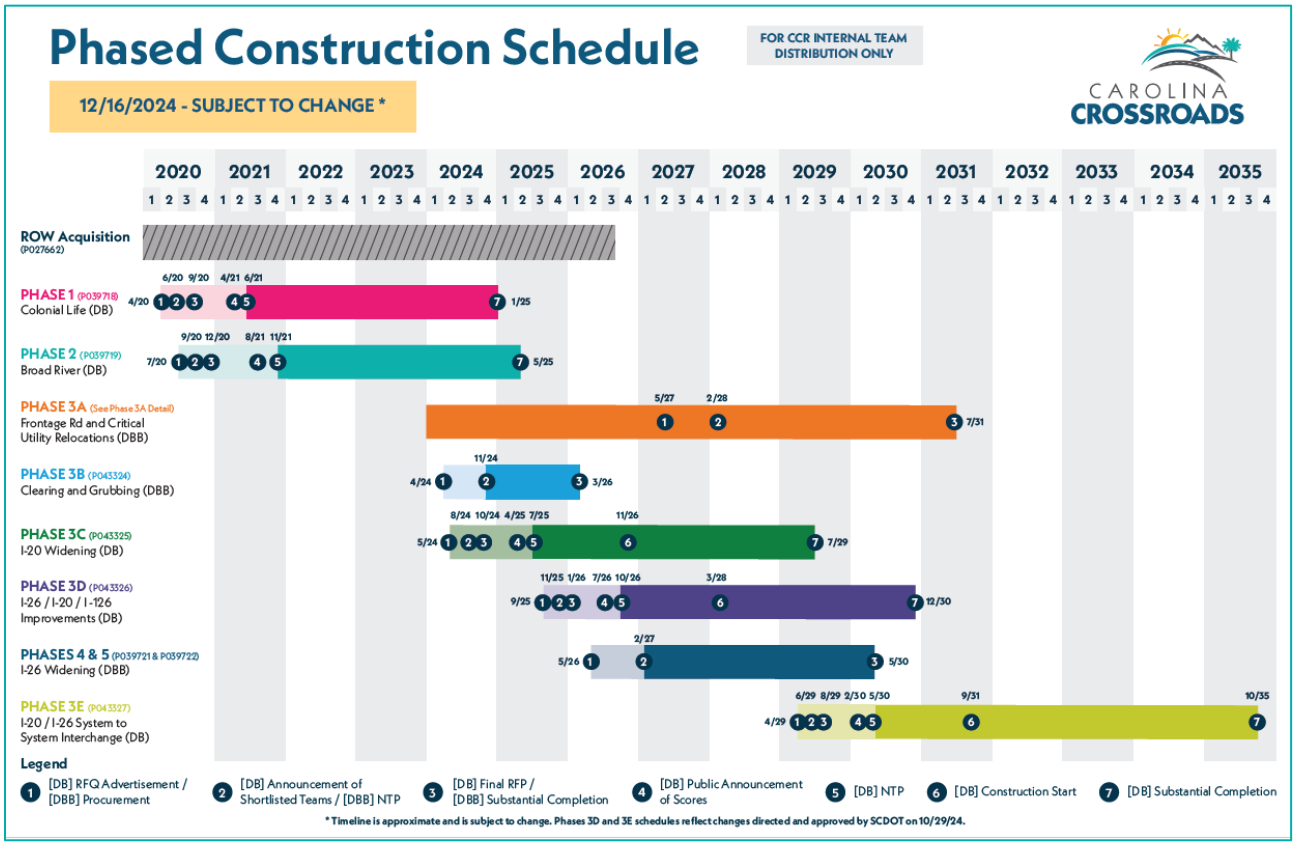
8.1 Consistency with Other Plans/Projects

This Project is included in the 2045 South Carolina Statewide Multimodal Transportation Plan and the South Carolina Statewide Transportation Improvement Program (STIP) (FY 2021 - 2027).

8.2 Project Schedule and Funding Plan

As the Carolina Crossroads Project has advanced through the initial construction phases and right-of-way acquisition, the schedule and phasing have been updated periodically. The latest phasing and schedule are shown in **Figure 28**.

Figure 28 - Project Schedule



8.3 Environmental Analysis Status

All phases of the project study area are covered under a single FEIS/ROD approved in May 2019, and the design changes in the Build Alternative (discussed in Section 5.1) will be included in a NEPA re-evaluation, which will be prepared after completion of this Systems IMR Re-evaluation.

8.4 Conceptual Signing Plan

A conceptual signing plan for the Build Alternative is provided in **Appendix H**.

8.5 Design Exceptions and Variations

The design exceptions and variations were coordinated with SCDOT and FHWA, and approved documents are included in **Appendix I**.

9. Interchange Justification

The original concept, Selected Alternative, received approval in May 2019, and modified concept, presented as the Build Alternative has been evaluated with respect to safety, operation, and engineering and was compared to the Selected Alternative and found to perform equal to or better.

Since the approval of the 2019 Systems IMR, the Selected Alternative (Approved 2019 Systems IMR configuration) design concept has been updated to accommodate refinements made during design build phases in construction and design refinements throughout the entire limits of the Carolina Crossroads Project. The version of the design concept that includes all of these changes is referred to as the MSA.

The June 2022 Technical Memorandum Modified Selected Alternative Phase 1/*Phase 2 Traffic Report documented* the analysis results of the mainline density segments for the 2040 Selected Alternative and the 2040 MSA. MSA network analyses MOEs were compared against the 2019 Systems IMR to demonstrate equal or better operations and safety.

Additionally, the Carolina Crossroads Project has been separated into five construction phases. Traffic Technical Memoranda addressing changes to the I-126 at Colonial Life Boulevard interchange and I-20 Exit 65 (Broad River Road) were submitted as part of the Phase 1 and Phase 2 design-build projects, ID P039718 and ID P039719, respectively, and subsequent National Environmental Policy Act (NEPA) Re-evaluations #1 and #5. In the new phasing plan for Carolina Crossroads Project, Phase 3 has been divided into subphases - A, B, C, D, and E.

The following section addresses the FHWA two interstate access policy point considerations and requirements.

9.1 Policy Point 1

An operational and safety analysis has concluded that the proposed change in access does not have a significant adverse impact on the safety and operation of the Interstate facility (which includes mainline lanes, existing, new, or modified ramps, ramp intersections with crossroad) or on the local street network based on both the current and the planned future traffic projections. The analysis should, particularly in urbanized areas, include at least the first adjacent existing or proposed interchange on either side of the proposed change in access (23 CFR 625.2(a), 655.603(d) and 771.111(f)). The crossroads and the local street network, to at least the first major intersection on either side of the proposed change in access, should be included in this analysis to the extent necessary to fully evaluate the safety and operational impacts that the proposed change in access and other transportation improvements may have on the local street network (23 CFR 625.2(a) and 655.603(d)). Requests for a proposed change in access should include a description and assessment of the impacts and ability of the proposed changes to safely and efficiently collect, distribute, and accommodate traffic on the Interstate facility, ramps, intersection of ramps with crossroad, and local street network (23 CFR 625.2(a) and 655.603(d)). Each request should also include a conceptual plan of the type and location of the signs proposed to support each design alternative (23 U.S.C. 109(d) and 23 CFR 655.603(d)).

Policy Point 1's intent is to require detailed operational and safety analysis of the relevant interstate segments and compare the project alternatives anticipated to occur during the project's Design Year (2050).

This re-evaluation documents the design refinements in Build Alternative, change in the Design Year from 2040 (in the 2019 Systems IMR) to 2050 and using the latest TransModeler (version 7) compared to the TransModeler (Version 4.0 Build 6275) used in the 2019 Systems IMR. New traffic data was collected in April 2024 and forecasted to Design Year 2050 using the 2019 Systems IMR growth rate (0.7 % annual growth rate). Detailed operational analyses were performed using TransModeler 7.0 for project alternatives for the AM and PM peak hours in the Design Year (2050).

The operational analysis conducted for this Systems IMR Re-evaluation confirmed that the proposed modifications in the Build Alternative will operate equal to or better than the approved Selected Alternative and the modifications are not expected to have any significant adverse impacts on safety operations and engineering. The following describes the operations and safety results of the analysis:

- The networkwide results indicate that the average speed has increased, and the travel time and total delay have decreased in the Build Alternative compared to the Selected Alternative.
- In the Build Alternative, all freeway, weave, and merge/ diverge segments are expected to operate at LOS D or better in 2050 AM and PM peak hours.
    - All I-20 eastbound and westbound segments are expected to operate at an average of LOS D or better during the AM and PM peak hours.
    - All I-26 eastbound and westbound segments are expected to operate at an average of LOS D or better during the AM and PM peak hours.
    - All westbound and eastbound segments along the I-126 corridor are expected to operate at an average of LOS C or better during AM and PM peak hours.
- Intersection delay and LOS results for study intersections show that the Build Alternative performs equal to or better compared to the Selected Alternative.
- The crash rate comparison demonstrated that the Build Alternative results in a lower crash rate across all crash severities compared to the Selected Alternative. While the fatal crash rate (K) remains unchanged for both alternatives, the Build Alternative shows improvements in all other categories. Specifically, it reduces the rates of incapacitating injury crashes (A) by 4%, non-incapacitating injury crashes (B) by 5%, possible injury crashes (C) by 2%, and property damage only crashes (O) by 6%. In total, the Build Alternative achieves an overall reduction of 5% in the total crash rate. This data highlights that the Build Alternative offers a safer outcome with a lower crash rate overall, supporting its potential as the preferred option.

9.2 Policy Point 2

The proposed access connects to a public road only and will provide for all traffic movements. Less than "full interchanges" may be considered on a case-by-case basis for applications requiring special access, such as managed lanes (e.g., transit, HOVs, HOT lanes) or park and ride lots. The proposed access will be designed to meet or exceed current standards (23 CFR 625.2(a), 625.4(a)(2), and 655.603(d)). In rare instances where all basic movements are not provided by the proposed design, the report should include a full-interchange option with a comparison of the operational and safety analyses to the partial-interchange option. The report should also include the mitigation proposed to compensate for the missing movements, including wayfinding signage, impacts on local intersections, mitigation of driver expectation leading to wrong-way movements on ramps, etc. The report should describe whether future provision of a full interchange is precluded by the proposed design.

Policy Point 2 requires the implementation of an interchange design for interstate access that allows for all relevant movements. The proposed improvements in the Build Alternative provide access to public roads and maintain full access. There are no partial interchanges in the study area.

10. Conclusion and Recommendations

The primary purpose of the proposed Carolina Crossroads Project is to implement a transportation solution(s) that would improve mobility and enhance traffic operations by reducing existing traffic congestion within the I-20/26/126 corridors while accommodating future traffic needs. The Systems IMR Re-evaluation was conducted to document the impacts of the following changes:

- Changes to the Design Year from 2040 to 2050
- Proposed changes to interchange configurations
- Change in the TransModeler version.

- Change in traffic data

Conclusion:

This Systems IMR Re-evaluation documented traffic operational analysis using the TransModeler version 7 and predictive safety analysis using ISATe. The analysis results indicate that the Build Alternative performs equal to or better than the Selected Alternative.

Recommendation:

The Build Alternative, which includes Phases 1, 2, and 3, is recommended for implementation based on its ability to continue to meet the project's purpose and need and satisfies the FHWA requirement that it performs equal to or better than the Selected Alternative.

Executive Summary

The South Carolina Department of Transportation (SCDOT) proposes multiple improvements to the I-20, I-26, and I-126 corridors within what is identified as the Carolina Crossroads study area. The limits of the Carolina Crossroads study area include approximately four miles of I-20 between the crossings over the Saluda River and Broad River, approximately nine miles of I-26 from Exit 101 (Broad River Rd) to Exit 110 (US 378), and approximately one mile of I-126 from I-26 to Colonial Life Boulevard.

The purpose of the proposed Carolina Crossroads project is to improve mobility, enhance traffic operations by reducing existing traffic congestion, accommodate future traffic needs, enhance safety throughout the corridor, improve freight mobility, and improve system linkages, while minimizing community and environmental impacts.

This interchange modification report (IMR) presents information for the proposed modification of the system interchanges of I-20/I-26 (I-20 Exit 64 and I-26 Exit 107) and I-26/I-126 (I-26 Exit 108) located in Lexington and Richland counties. The proposed modifications to the system interchanges will also affect closely spaced adjacent interchanges which are also to be modified. These interchanges include the I-26 Exit 106 (St Andrews Road), I-20 Exit 63 (Bush River Road), I-20 Exit 65 (Broad River Road) and the I-126 interchange at Colonial Life Boulevard.

As part of the project development, nine representative alternatives for the entire Carolina Crossroads study area were developed, along with a tenth 'no-build' alternative. From these alternatives, the Refined Recommended Preferred Alternative (RRPA) was identified. The I-20/I-26 and I-26/I-126 system interchanges and adjacent service interchanges in the RRPA are proposed to be modified as follows:

- I-20/I-26 System Interchange: the existing full cloverleaf interchange (I-20 Exit 64 and I-26 Exit 107) will be modified to a directional 'turbine' interchange. Multiple existing complex weaving movements will be eliminated from the mainline and relocated to collector-distributor roads which will be constructed in each direction on I-20 and I-26 to separate movements traveling between I-20 and I-26 from through traffic on the mainline travel lanes.
- I-26/I-126 System Interchange: the existing interchange (I-26 Exit 108), which includes ramps from I-26 to Bush River Road, will be modified to eliminate the ramps to Bush River Road, improve the continuity of I-26, and revise the connection to and from I-126.
- I-20 Exit 63 (Bush River Road): the existing diamond interchange, which includes a loop on-ramp from eastbound Bush River Road to eastbound I-20, will be modified to provide a diverging diamond interchange. This modification includes eliminating the intersection of Berryhill Drive with Bush River Road and adding an overpass to connect Berryhill Drive over I-20 to Bush River Road via Rockland Road.
- I-20 Exit 65 (Broad River Road): the existing diamond interchange at Broad River Road, which includes a short, two-way segment on the eastbound on-ramp to connect Garner Lane to Broad River Road, will be modified to provide a single point urban interchange. The Garner Lane connection to the off-ramp will be eliminated, making the interchange consistent with current standards and FHWA policy. A new connection will link Garner Road to Longcreek Drive.

- I-26 Exit 106 (St Andrews Road): the existing partial cloverleaf interchange includes a westbound loop off-ramp and eastbound loop on-ramp to and from westbound St Andrews Road. It will be modified to provide a single point urban interchange. The connections from the westbound off-ramp to eastbound St Andrews Road and to Burning Tree Drive will be maintained and adjusted to connect to the remainder of the modified interchange.
- I-26 Exit 110 (US 378): the existing single point urban interchange will remain unchanged; however, the eastbound off-ramp to US 378 will be relocated and extended by approximately 2,500 feet to reduce or eliminate the potential for off-ramp traffic queues from extending back to the eastbound I-26 mainline lanes.
- I-126 Colonial Life Boulevard: the existing partial interchange with ramps only oriented to and from downtown Columbia to the east will be replaced with a full access tight urban diamond interchange.

The portion of the RRPA evaluated in this IMR is shown in Figure E-1.

The analysis of the 2040 Build condition of the RRPA illustrates that the project would not have any significant negative impact on the safety and the operation of the facilities within the project area. The increased capacity provided by the RRPA will result in improved LOS over the 2040 No-Build conditions.

The I-20 Exit 61 (US 378) westbound off-ramp, outside of the project limits, may substantially affect the westbound mainline density and Exit 63 (Bush River Road) westbound merge operations due to high ramp volumes and congestion identified along US 378 at Exit 61.

Because of the distance between Exit 65 (Broad River Road) and Exit 68 (Monticello Road), the bridge crossing the Broad River creating a barrier, and the widening of I-20 ends east of the Broad River crossing, FHWA and SCDOT agreed that the Exit 68 interchange would not influence operations at Exit 65. However, with increased volumes and improved throughput within the system-to-system interchange, heavy queuing and ramp backup along I-20 eastbound was identified, due to the mainline capacity constraint that occurs at the eastern project limits as the proposed four lane section transitions into the existing three lane section at the bridge across Broad River just east of Exit 65.

The proposed interchange improvements at the system interchanges and the addition of the collector-distributor road systems along I-20 and I-26 should improve traffic operations and safety by removing the numerous existing vehicle conflict points and relocating merge/diverge areas and weaving sections within the study area from the mainline lanes to the collector-distributor lanes. By removing the Bush River Road ramps at Exit 108, the short weaving section between the ramp from eastbound I-20 to eastbound I-26 and the eastbound off-ramp to Exit 108 is eliminated. The congestion caused by the complex westbound weaving movements to travel to I-20 and to Exit 106 (St Andrews Road) after I-126 merges with I-26 is also eliminated.

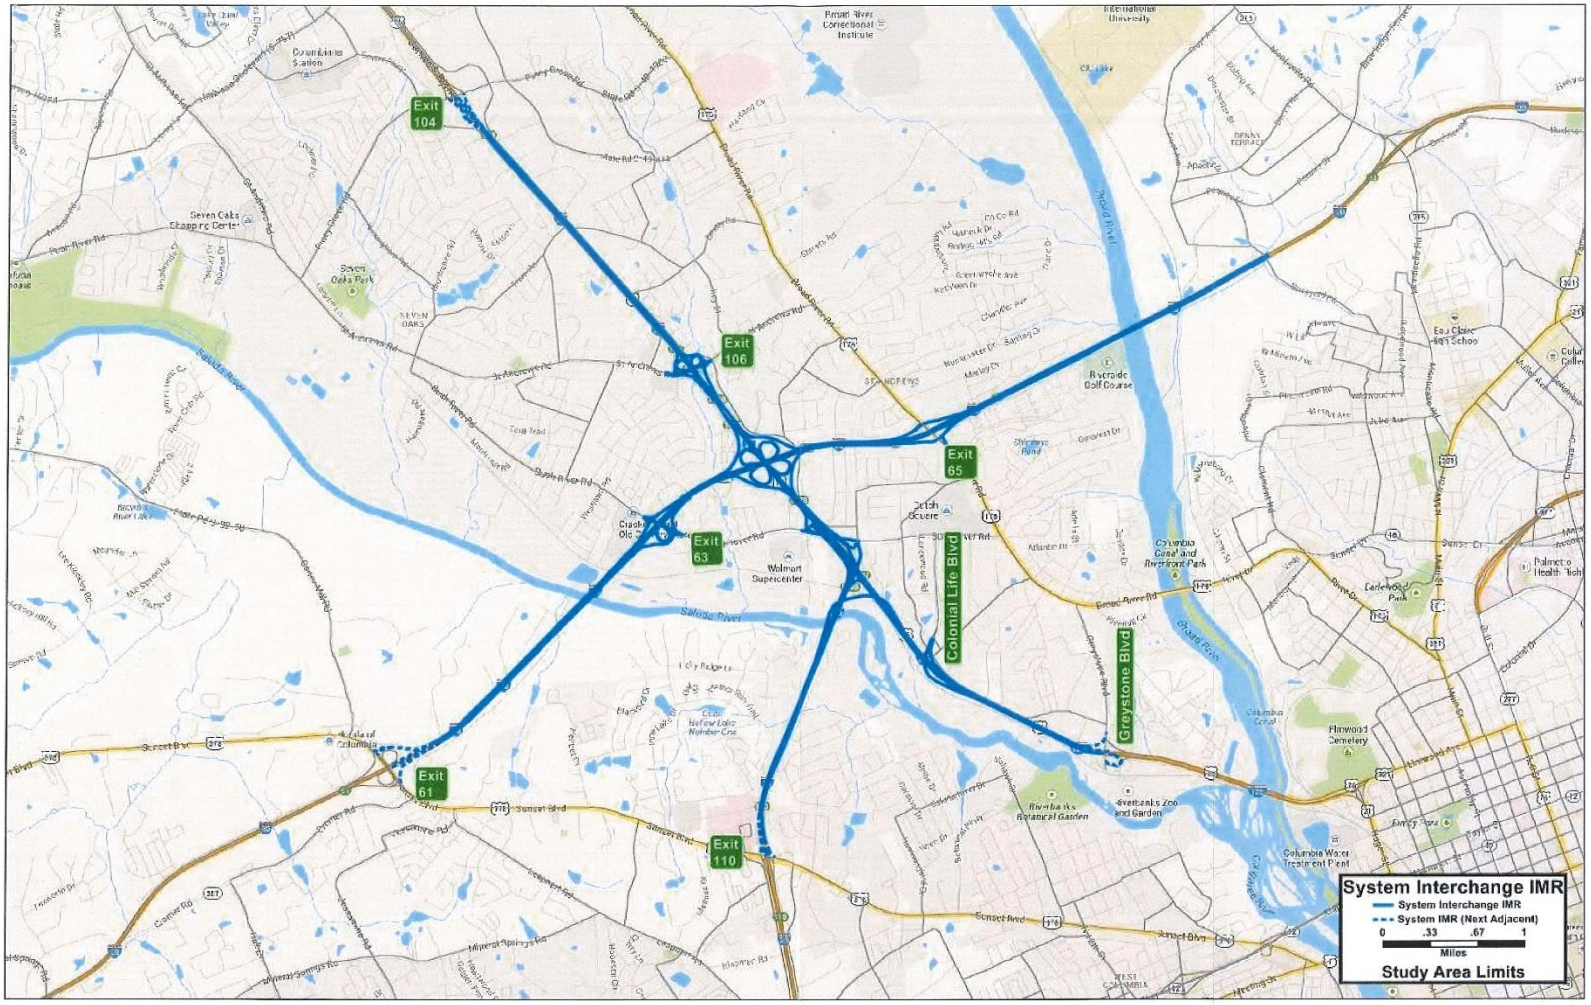

Figure E-1 - IMR Study Area

1 Introduction

STV, in cooperation with HDR and Mead & Hunt (the project team), has been contracted by the South Carolina Department of Transportation (SCDOT) to provide engineering services necessary for the preparation of an Environmental Impact Statement (EIS), right of way plans, and final construction plans for roadways and bridges for the proposed Carolina Crossroads I-20/I-26/I-126 Corridor Project.

I-20 is an east-west interstate highway that begins near Kent, Texas at I-10. From this origin, I-20 runs eastward through Texas, Mississippi, Alabama, Georgia and South Carolina where it ends at I-95 in Florence, South Carolina. I-26 is an east-west interstate highway that begins at the junction of U.S. Route 11W and U.S. Route 23 in Kingsport, Tennessee. From this origin, I-26 runs generally southeastward through Tennessee, North Carolina, and South Carolina, where it ends at U.S. Route 17 in Charleston, South Carolina. I-126 is an east-west auxiliary route of I-26 that begins and ends in Columbia, South Carolina.

Figure 1-1 - Carolina Crossroads Study Area

The proposed project is a transportation corridor improvement project located in Lexington and Richland counties. To date, the project area has been defined as a mainline corridor including I-20 from the Saluda River to the Broad River (approximately four miles), I-26 from Broad River Road to US-378 (approximately nine miles), and I-126 from I-26 to Colonial Life Boulevard (approximately one mile. **Figure 1.1** illustrates the extent of the Carolina Crossroads study area.

The I-20/I-26/I-126 corridor is a vital link in South Carolina, serving residents, commuters, travelers, and commerce. Due to nearby residential and commercial development, proximity to downtown Columbia, traffic volumes, and the overall geometric layout, including 12 interchange points, the I-20/I-26/I-126 corridor has become one of the most congested interstate sections in South Carolina. The purpose of the proposed project is to address this congestion and enhance safety throughout the corridor.

Information discussed in the report is derived from the following project reports: *Alternatives Traffic Analysis: Carolina Crossroads I-20/I-26/I-126 Corridor Project, Crash Analysis: Carolina Crossroads I-20/I-26/I-126 Corridor Project, Carolina Crossroads I-20/I-26/I-126 Corridor Improvement Project Draft Environmental Impact Statement (DEIS).*

The *Alternatives Traffic Analysis* study evaluated multiple improvements within the I-20/I-26/I-126 corridor designed to reduce existing traffic congestion, upgrade interchanges to meet design requirements, and accommodate future traffic needs. The study considered widening of I-20 from three to four lanes in each direction from about one mile west of Exit 63 (Bush River Road) to Broad River, widening of I-26 from three to four lanes in each direction from just west of Exit 101 (Broad River Road) to Exit 110 (US 378), and realigning the connection to I-126 from I-26 towards the Colonial Life Boulevard interchange. In addition, the study examined modifications to the I-20/I-26/I-126 system interchange, Exit 101 (Broad River Road), Exit 102 (Lake Murray Boulevard), Exit 103 (Harbison Boulevard), Exit 104 (Piney Grove Road), Exit 106 (St. Andrews Road), Exit 108 (Bush River Road), Exit 110 (US 378), Exit 63 (Bush River Road), Exit 65 (Broad River Road), and the Colonial Life Boulevard interchange on I-126.

2 Background

The Carolina Crossroads Project includes three interstate routes and incorporates the modification of the I-20/I-26 system interchange (Exit 64/Exit 107) and the I-26/I-126 system interchange (Exit 108). Several immediately adjacent service interchanges are expected to be modified as well. Due to the close proximity and interconnected movements of the service interchanges with the system interchanges, the modification of all the interchanges are to be evaluated collectively. The modified interchanges to be evaluated in this IMR include:

- Exit 106: I-26 at St. Andrews Road (S-32-36/S-40-42)
- Exit 64/Exit 107: I-26 at I-20
- Exit 108: I-26 at Bush River Road (S-40-31);
- Exit 108: I-126 at I-26
- Exit 63: I-20 at Bush River Road (S-32-273)
- Exit 65: I-20 at Broad River Road (US 176)
- I-126 at Colonial Life Boulevard (S-40-2963)

To address Federal Highway Administration (FHWA) requirements, adjacent interchanges analyzed as part of this IMR include the following:

- Exit 104: I-26 at Piney Grove Road (S-32-671)
- Exit 110: I-26 at US 378 (Sunset Boulevard)
- Exit 61: I-20 at US 378 (Sunset Boulevard)
- I-126 at Greystone Boulevard (S-40-3020)

The interchange at Exit 68 (I-20 at Monticello Road/SC 215) is the interchange adjacent to Exit 65 (I-20 at Broad River Road). However, FHWA has provided concurrence that this interchange will be excluded from consideration in this IMR since its distance from the Exit 64 system interchange (approximately three miles) and

the barrier created by the bridge crossing the Broad River effectively limits its influence on the subject interchange operations.[1]

This report focuses on traffic analysis of existing, future no-build, and future build conditions. The traffic conditions were analyzed for the following scenarios:

- Existing Conditions: An analysis of existing conditions in the year 2015
- 2040 No-Build: An analysis of conditions in the year 2040 with no changes to the interstate or interchanges.
- 2040 Build: An analysis of conditions in the year 2040 with modifications to the study area interstate and interchanges.

2.1 Existing Conditions

2.1.1 I-26

Eastbound I-26 approaches the study area from the northwest, entering from Richland County as a two lane section with a posted 70 miles per hour (mph) speed limit. Approximately 1,900 feet in advance of the off-ramp to Exit 101 (Broad River Road), the speed limit is reduced to 60 mph. Approximately 850 feet in advance of the Exit 101 off-ramp, I-26 begins to transition to provide a third lane, which is fully established approximately 525 feet in advance of the off-ramp. Immediately south of Exit 103 (Harbison Boulevard), I-26 crosses into Lexington County. Approximately 2,000 feet in advance of Exit 106 (St Andrews Road), the speed limit is reduced to 55 mph.

At Exit 106 (St Andrews Road), two lanes are added. The first additional lane is a continuation of the loop on-ramp from westbound St Andrews Road, while the second lane is a continuation of the on-ramp from eastbound St Andrews Road. This fifth lane drops at the off-ramp to westbound I-20, with the four lane section traversing the I-20 system interchange (Exit 107). At the I-20 system interchange, I-26 crosses back into Richland County for a short distance. The four lanes approach the I-126 split, where the left two lanes continue eastbound on I-126 towards downtown Columbia, a "decision lane" continues to either I-126 or I-26, and the right lane continuing eastbound on I-26. There is a 50 mph posted advisory speed on the I-26 curve at this split.

I-26 continues eastbound on two lanes crossing back into Lexington County at the Saluda River, where a lane is added from the ramp from westbound I-126. The speed limit increases to 60 mph in this area. I-26 continues on three lanes past Exit 110 (US 378) and exits the study area south of that interchange.

Westbound I-26 enters the study area in Lexington County south of Exit 110 (US 378) as a three lane section with a posted 60 mph speed limit. The two lane westbound on-ramp from Exit 110 merges and adds a fourth westbound lane. Approaching the bridge over the Saluda River, the posted speed limit on I-26 is reduced to 55 mph, with the left two lanes designated to continue as I-26 towards Spartanburg and the right two lanes exiting to Bush River Road and I-126 towards Columbia at Exit 108.

[1] Memo from SCDOT to FHWA, June 1, 2018

As it crosses the Saluda River, I-26 enters Richland County and crosses over I-126 as it curves to the northwest with an advisory speed limit of 50 mph. These two lanes are joined to their left by two westbound lanes continuing from I-126 into I-26, and to their right by a single lane ramp that combines a lane from I-126 and directs traffic to I-20 with the on-ramp from Bush River Road (Exit 108), creating a five-lane section. This five lane section continues for approximately 1,100 feet until the right lane drops on the off-ramp to eastbound I-20. I-26 continues as a four lane section through the system interchange with I-20 (Exit 107), where it exits Richland County and re-enters Lexington County.

The on-ramp from westbound I-20 adds a fifth lane to I-26, creating a weaving section approximately 1,300 feet long before the fifth lane drops at Exit 106 (St Andrews Road) as an exit ramp taking traffic to eastbound St Andrews Road. After crossing under the St Andrews Road overpass, the fourth lane drops at the loop off-ramp to westbound St. Andrews Road. From here, I-26 continues westbound as a three lane section. The posted speed increases to 60 mph approximately 2,200 feet north of the Exit 106 westbound on-ramp. I-26 re-enters Richland County just south of the Harbison Boulevard overpass at Exit 103 and continues west as a three lane, 60 mph section to the west of Exit 101 (Broad River Road). About 550 feet west of the Exit 101 on-ramp, the inside lane begins its merge to create a two-lane section, which begins approximately 1,050 feet to the west. I-26 westbound exits the study area as a two-lane section, transitioning to a 70-mph posted speed limit at a point approximately 2,700 feet west of the Exit 101 on-ramp.

2.1.2 I-20

Eastbound I-20 approaches the study area from the west. Entering the study area in Lexington County at its crossing of the Saluda River, I-20 eastbound provides three lanes with a posted 60 mph speed limit. At Exit 63 (Bush River Road), the loop on-ramp from southbound Bush River Road adds a fourth lane, which is dropped approximately 2,650 feet to the east at the off-ramp to eastbound I-26. I-20 continues east with three lanes through the I-26 system interchange (Exit 64) where it enters Richland County, and past Exit 65 (Broad River Road). It exits to the east of study area at the bridge over the Broad River with three lanes and a 60 mph posted speed limit.

Westbound I-20 approaches the study area from the east. Entering the study area in Richland County at its crossing of the Broad River, I-20 westbound provides three lanes with a posted 60 mph speed limit. I-20 continues west with three lanes through the I-26 system interchange (Exit 64), where a fourth lane is added from the on-ramp from eastbound I-26. This four lane section continues for approximately 1,100 feet before it drops at the off-ramp to Exit 63 (Bush River Road). I-20 continues as a three lane, 60 mph section to the west where it leaves the study area at the bridge over the Saluda River.

2.1.3 I-126

Eastbound I-126 begins where I-26 splits to continue to the east towards downtown Columbia and towards Charleston. Of the four eastbound lanes approaching this system interchange, the two left lanes continue through as I-126, while the third lane from the inside is a “decision” lane where traffic may continue on I-126 or on I-26. I-126 continues eastbound towards downtown Columbia as a three lane, 60 mph section. Approximately 1.25 miles from its separation from I-26, the on-ramp from Colonial Life Boulevard adds a fourth

lane to the south. I-126 continues as a four lane section to its terminus, where the left two lanes become eastbound Elmwood Avenue and the right two lanes become southbound Huger Street, with the speed limit dropping to 35 mph approximately 800 feet in advance of the split.

Westbound I-126 begins where westbound Elmwood Avenue and northbound Huger Street merge just east of the bridge over the Broad River to create a four lane section with a posted 60 mph speed limit. I-126 continues westbound past the Greystone Boulevard interchange and the off-ramp to Colonial Life Boulevard. Approximately 2,000 feet north of the Colonial Life Boulevard exit, the right lane of I-126 drops as a flyover exit ramp to eastbound I-26. I-126 continues westbound for about 2,000 feet, where the left two lanes continue through to become the inside two lanes of westbound I-26, and the right lane bends right as a ramp directing traffic to eastbound and westbound I-20. Between these split lanes, two lanes from westbound I-26 enter from the curved flyover to create a five lane section of I-26.

2.1.4 INTERCHANGES

There are two system and eleven service interchanges within the study area. The system interchanges are at the junction of I-26 and I-20 (Exit 107 on I-26 and Exit 64 on I-20) and at the junction of I-26 and I-126 (Exit 108). There are seven service interchanges along I-26 (Exits 101, 102, 103, 104, 106, 108, and 110), two along I-20 (Exits 63 and 65) and two on I-126 (Colonial Life Boulevard and Greystone Boulevard).

2.1.4.1 System Interchanges

There are two system interchanges located within the study area. The I-20/I-26 system interchange is numbered as I-20 Exit 64 and I-26 Exit 107. Exit 108 combines elements of the I-26/I-126 system interchange with a service interchange providing for movements to/from Bush River Road.

I-20/I-26 System Interchange - Exit 64/Exit 107

The I-20/I-26 System interchange is a full access cloverleaf interchange. The cloverleaf interchange introduces short weaving sections between the two loop ramps located in each direction on I-20 and I-26. The spacing of the system interchange to the next adjacent interchanges is short. The distance between the weaving gore areas on Exit 107 and Exit 106 is about 1,500 feet. The weaving section distance between the Exit 107 and Exit 108 ramps is about 800 feet in the eastbound direction and about 1,200 feet in the westbound direction. The distance between Exit 63 and Exit 64 ramps is 1,500 feet in the eastbound direction and about 1,100 feet of weaving section in the westbound direction. The distance between Exit 64 and Exit 65 ramps are slightly longer at about 2,600 feet in the eastbound direction and about 2,000 feet in the westbound direction. The interchange configuration, its close spacing to the adjacent interchanges and the numerous complex weaving movements introduced in this area increase vehicle conflicts that can reduce safety and contribute to congestion in the corridor during peak periods. The existing configuration of the Exit 64/Exit 107 system interchange is shown in **Figure 2.1**.

I-26/I-126 System Interchange – Exit 108

The I-26/I-126 interchange provides full access movements between the two interstate routes and includes a flyover ramp from westbound I-126 to eastbound I-26. Westbound I-26 also travels on a flyover ramp prior to its merge with westbound I-126.

Exit 108 also provides full access to/from I-26 to Bush River Road.

The existing configuration of the I-26/I-126 interchange is shown in **Figure 2.2**.

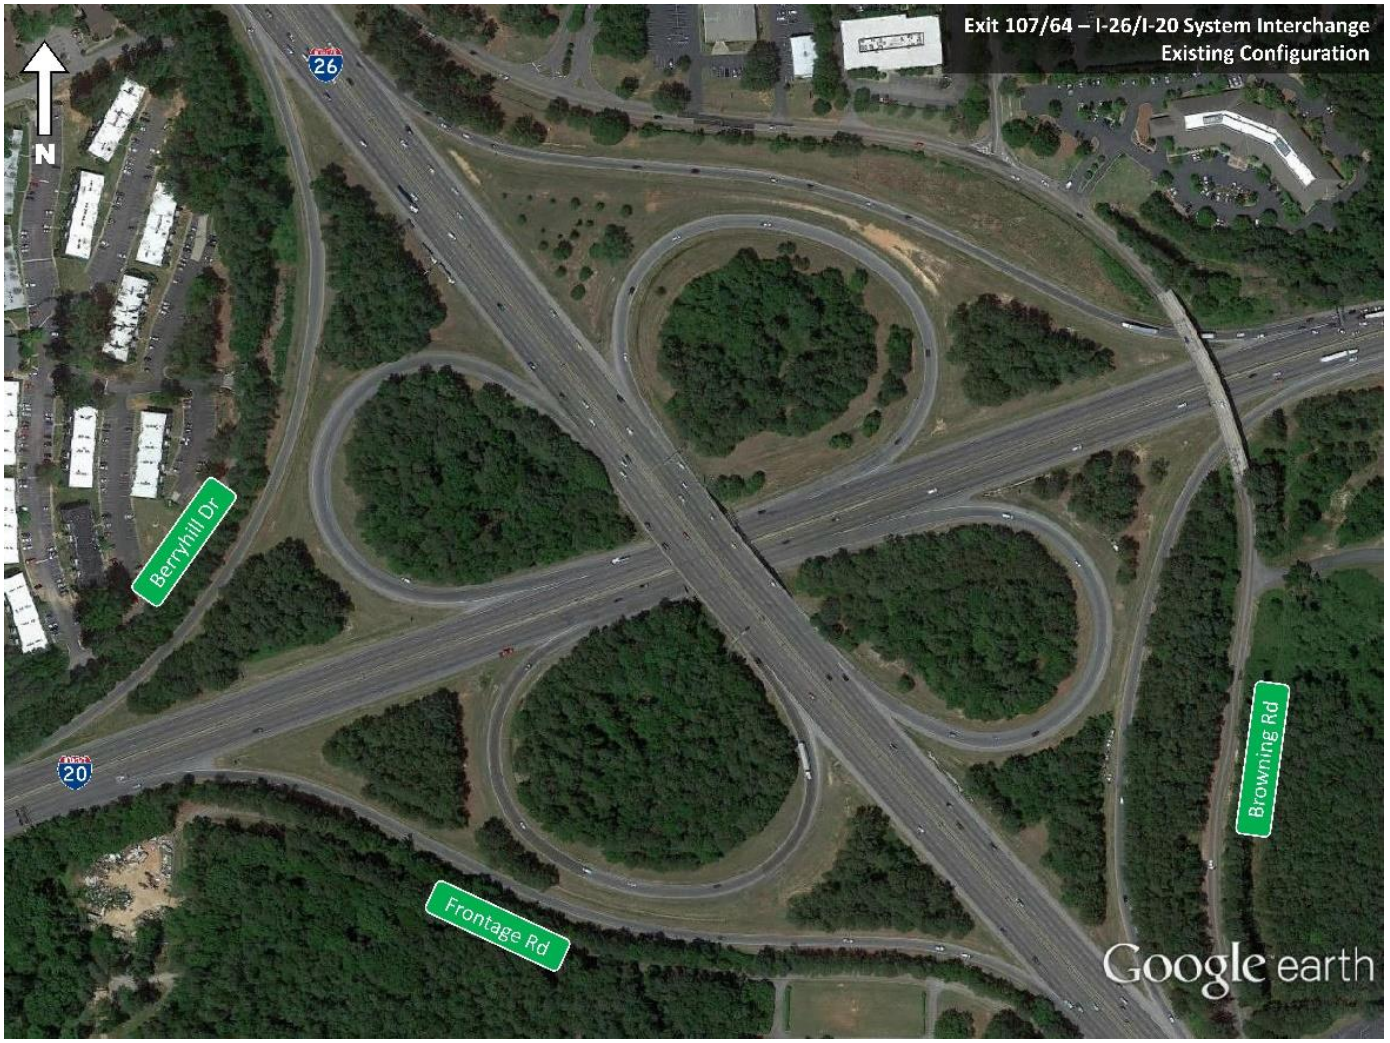

Figure 2-1 - I-20/I-26 System Interchange Existing Configuration

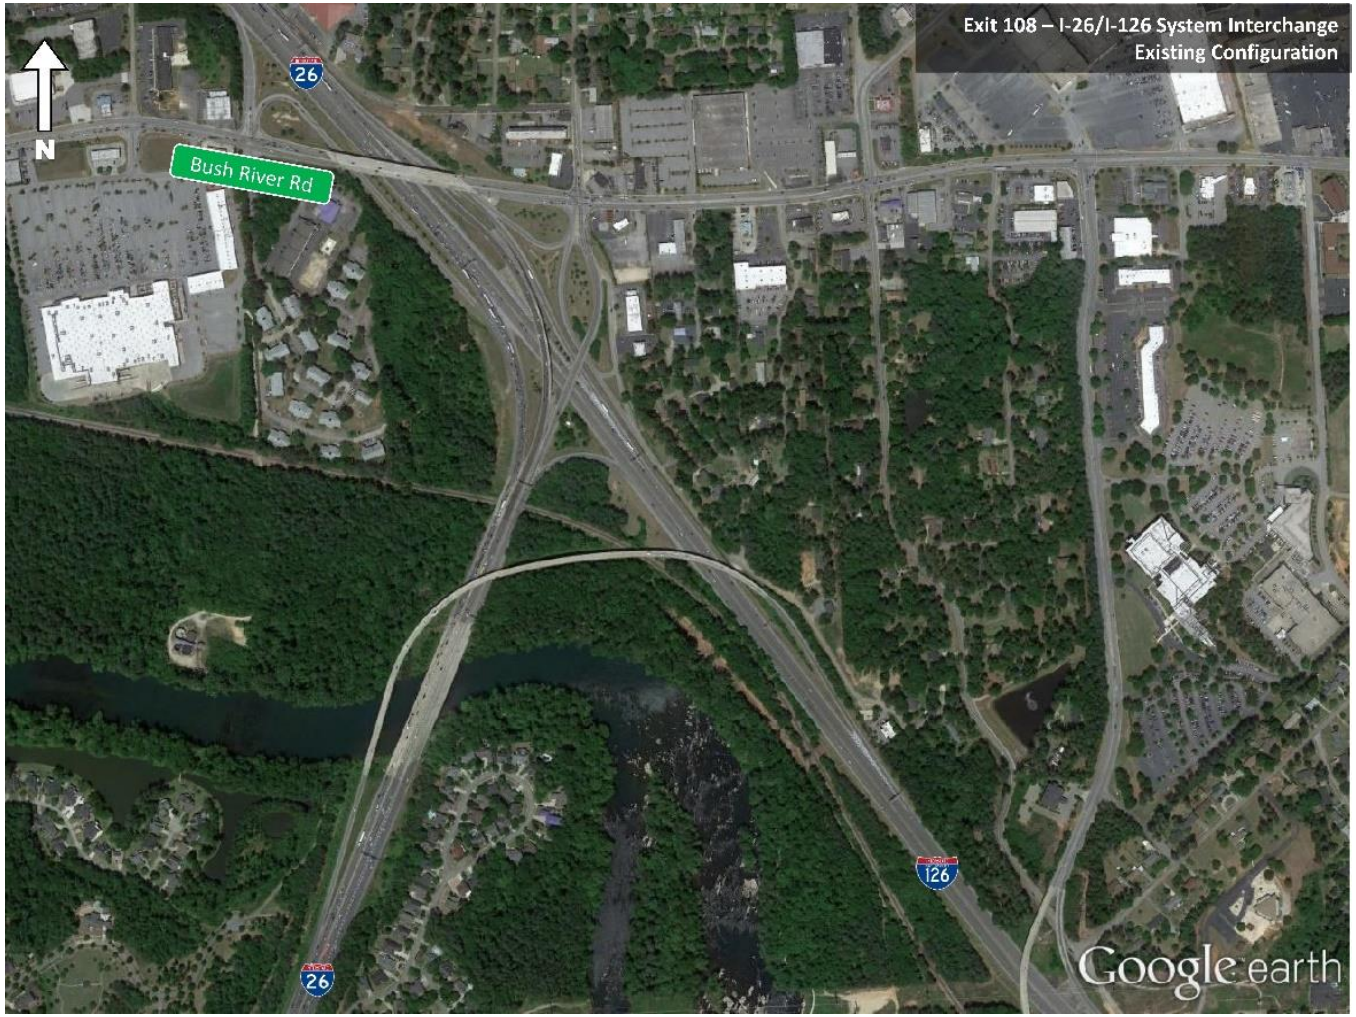

Figure 2-2 - I-26/I-126 System Interchange Existing Configuration

2.1.4.2 I-26 Service Interchanges

Of the seven I-26 service interchanges within the Carolina Crossroads study area, three I-26 service interchanges are located within the I-20/I-26/I-126 IMR study area. Two of these interchanges, Exits 106 and 110, are separate, full access interchanges. Exit 108 combines elements of the I-26/I-126 system interchange with a service interchange providing for movements to/from Bush River Road.

Exit 106 – St. Andrews Road (S-32-36/S-40-42)

Exit 106 is a partial cloverleaf interchange with loop ramps located on the northeast and northwest quadrants. The two westbound off-ramps to eastbound and westbound St. Andrews Road are lane drops from westbound I-26. The two eastbound on-ramps from westbound and eastbound St. Andrews Road are lane additions to eastbound I-26. The westbound on-ramp carries traffic from eastbound and westbound St. Andrews Road with an acceleration lane of about 1,500 feet. A traffic signal controls the eastbound off-ramp intersection with St. Andrews Road. Woodland Hills Road is aligned opposite the eastbound off-ramp at this intersection.

The westbound off-ramp to eastbound St. Andrews Road is divided into two movements. The first ramp movement connects to Burning Tree Road. At the stop sign controlled intersection with Burning Tree Road, right turning traffic can travel east on Burning Tree Road. Traffic that is intending to access Fernandina Road is supposed to use this ramp, turn left onto Burning Tree Road and cross St. Andrews Road. The second ramp is intended primarily for traffic that is traveling east on St. Andrews Road through its intersection with Fernandina Road/Burning Tree Road.

In reality, traffic traveling to Fernandina Road tends to bypass the first ramp movement to Burning Tree Road, travels to the end of the ramp and attempts to cross two lanes of eastbound St. Andrews Road to enter the left turn lane to Fernandina Road, which extends back to where the off-ramp intersects St. Andrews Road.

The existing configuration of Exit 106 is shown in **Figure 2.3**.

Exit 108 – Bush River Road (S-40-31)

The service interchange portion of Exit 108 is mixed in with the system interchange between I-26 and I-126. The service interchange to Bush River Road provides full access between that arterial and I-26. The off-ramps to Bush River Road are both lane drops. The eastbound off-ramp is a lane drop at the end of an approximately 720 feet long weaving section created by the Exit 107 on-ramp from eastbound I-20 to eastbound I-26. The westbound off-ramp drops from westbound I-26 along with the westbound off-ramp to eastbound I-126. The westbound off-ramp to Bush River Road is intersected by Morninghill Drive prior to its intersection with Bush River Road.

The loop on-ramp from Bush River Road to eastbound I-26 includes a long ramp section, approximately 1,400 feet long, that runs parallel to I-26 prior to merging into it. The westbound on-ramp traffic from Bush River Road is mixed with traffic traveling on the approximately 1,525 feet long ramp lane created by the rightmost lane of westbound I-126 that runs parallel to and on the eastside of westbound I-126 and I-26. Both ramp intersections at Bush River Road are controlled by traffic signals.

No direct access is provided from Bush River Road to I-126 within this interchange. Traffic traveling to/from Bush River Road to I-126 must use the Colonial Life Boulevard interchange on I-126.

The existing configuration of Exit 108 is shown in **Figure 2.4**.

Exit 110 – Sunset Boulevard (US 378)

Exit 110 is a single point urban interchange (SPUI). A regional hospital is located in the northwest quadrant of the interchange. The left turn movements to and from the ramps at this interchange are controlled by a traffic signal. The off-ramp right turn movements are controlled by stop signs. This configuration, combined with closely spaced signalized intersections and heavy traffic on Sunset Boulevard, frequently results in traffic queuing back on the off-ramps during peak period congestion. These off-ramp queues can extend back onto the I-26 mainline.

The existing configuration of Exit 110 is shown in **Figure 2.5**.

Figure 2-3 - Exit 106 Existing Configuration

Figure 2-4 - Exit 108 Existing Configuration

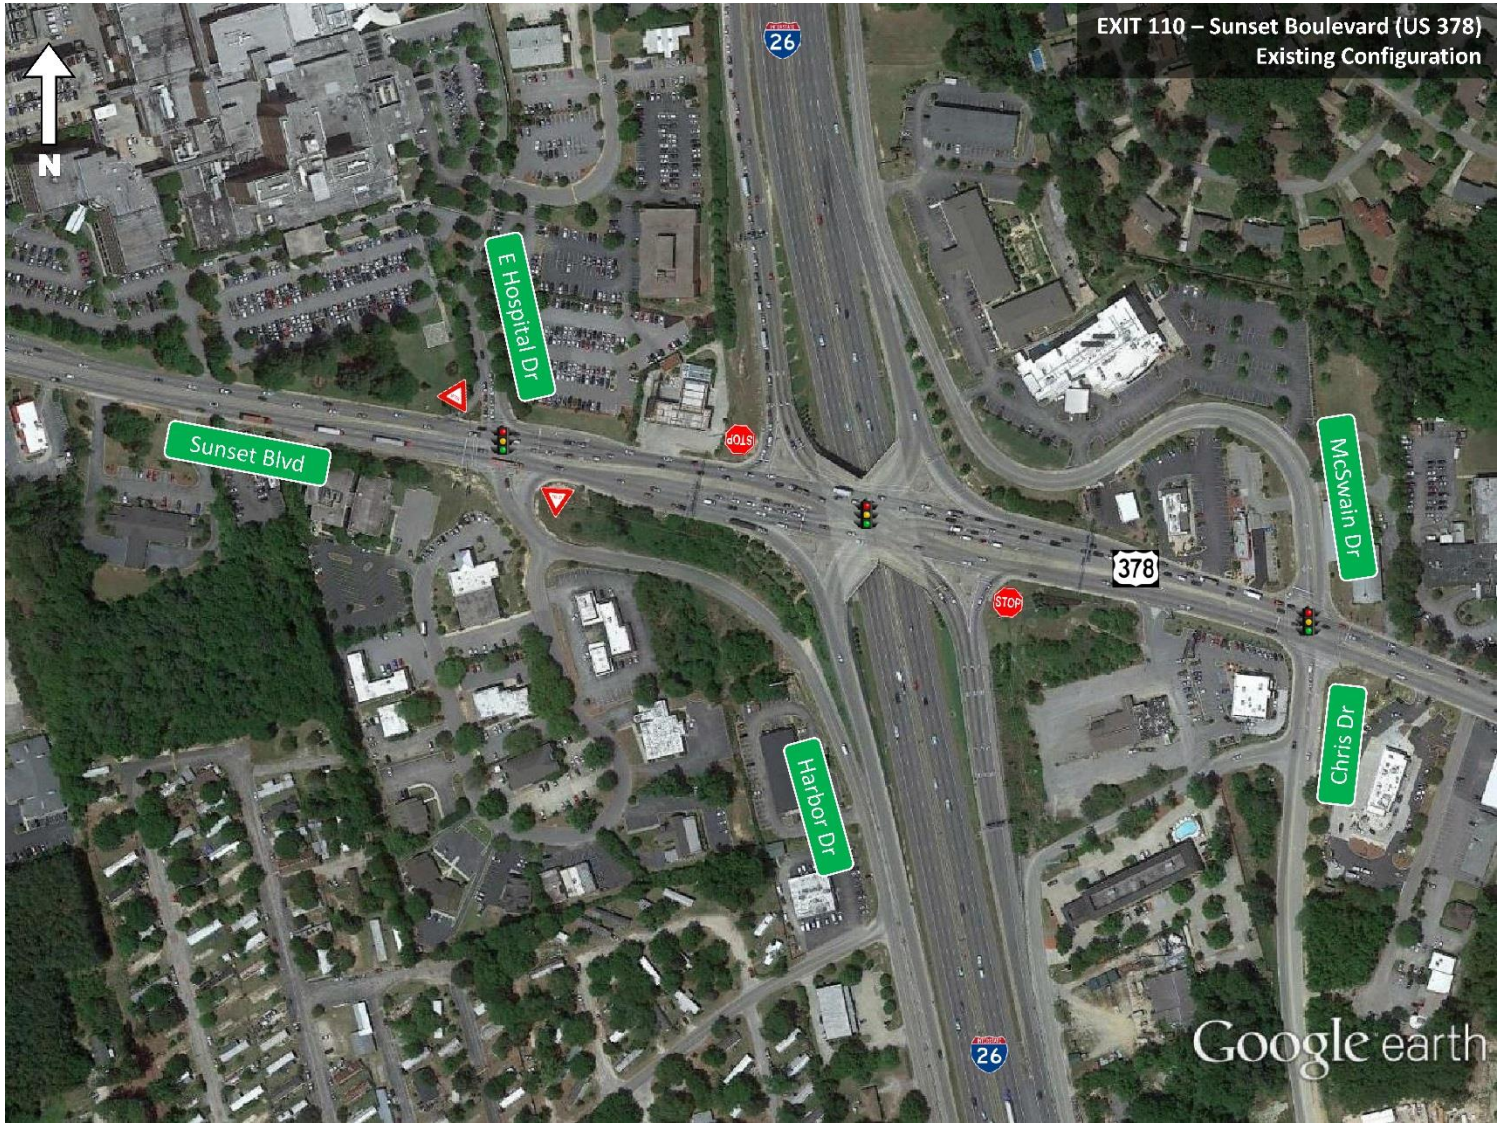

Figure 2-5 - Exit 110 Existing Configuration

2.1.4.3 I-20 Interchanges

There are two service interchanges located within the study area along I-20.

Exit 63 – Bush River Road (S-32-273)

Exit 63 is a modified diamond interchange that includes on-ramps to access eastbound I-20, including a loop ramp in the southeast quadrant. These movements operate without traffic control. The westbound ramps and the eastbound off-ramp intersections along Bush River Road are controlled by traffic signals.

The eastbound loop on-ramp adds a lane onto eastbound I-20. This lane continues eastbound, with the eastbound on-ramp carrying traffic from westbound Bush River Road merging into it before it is dropped at the ramp to eastbound I-26 at Exit 64.

The existing configuration is of Exit 63 is shown in **Figure 2.6**.

Exit 65 – Broad River Road (US 176)

Exit 65 is a diamond interchange. The westbound off-ramp has a two stage, two lane diverge movement, with the initial single lane off ramp forming a two-lane off-ramp to Broad River Road. The first portion of the eastbound on-ramp from Broad River Road, is a two-way, two lane roadway approximately 380 feet long that connects to Garner Lane. Garner Lane is a two lane local roadway with a posted 35 mph speed limit. East of its intersection with Garner Lane, the eastbound on-ramp becomes a one-way ramp that enters eastbound I-20. Traffic from Garner Lane can turn right at its intersection with the on-ramp to enter eastbound I-20. The ramp intersections with Broad River Road are controlled by traffic signals.

The existing configuration of Exit 63 is shown in **Figure 2.7**.

Figure 2-6 - Exit 63 Existing Configuration

Figure 2-7 - Exit 65 Existing Configuration

2.1.4.4 I-126 Interchanges

There is one service interchange located within the study area along I-126. The interchanges along I-126 do not have exit numbers based on the mile marker locations; they are described based on the name of the arterial to which they connect.

Colonial Life Boulevard (S-40-8970)

The Colonial Life Boulevard interchange is a partial interchange, only providing access to and from downtown Columbia via an on-ramp to eastbound I-126 and an off-ramp from westbound I-126. The Colonial Life Boulevard interchange ramps become Colonial Life Boulevard W, which ends at its intersection with Bush River Road.

The existing interchange configuration of Colonial Life Boulevard is shown in **Figure 2.8**.

Figure 2-8 **- Colonial Life Boulevard Existing Configuration**

2.1.5 FRONTAGE ROAD SYSTEM

An extensive system of Frontage Roads are present adjacent to I-26, I-20, and I-126 within the study area. These frontage roads provide alternatives for local traffic to avoid using interstates for short distance and/or local trips, and can be used to relieve congested interstate traffic during normal congestion or incidents.

2.1.5.1 I-26 Frontage Roads

Extensive frontage roads are present on both sides of I-26 between Exit 101 (Broad River Road) and Exit 110 (US 378). The frontage road network parallel to I-26 does not extend between Exit 108 (Bush River Road) and Exit 110 (US 378) due to the need to cross the Saluda River. For the IMR, the frontage roads adjacent to the Exit 107 system interchange with I-20, and accessible via the existing adjacent interchanges at Exit 106, Exit 108 and Exit 110 are summarized as follows.

Jamil Road (S-32-1791)

Jamil Road begins at Piney Grove Road opposite Bower Parkway. Jamil Road continues to run generally parallel to eastbound I-26 to its terminus at Saint Andrews Road approximately 815 feet west of the eastbound off-ramp at Exit 106 (St Andrews Road).

Fernandina Road (S-32-1842/1925, S-40-2893/3021/3045)

Fernandina Road begins at its intersection with Woodcross Drive near Exit 103 (Harbison Boulevard). Woodcross Drive begins opposite the westbound loop off-ramp at Exit 103. Fernandina Road runs generally parallel to the westbound lanes of I-26 and intersects Piney Grove Road approximately 800 feet east of the westbound ramp intersection at Exit 104.

Fernandina Road continues south of Piney Grove Road to its terminus at its intersection with St Andrews Road approximately 275 feet east of the westbound ramp intersection at Exit 106.

Berryhill Drive (S-32-1551)

Berryhill Drive begins at its intersection with Woodland Hills Road approximately 100 feet south of St. Andrews Road. Woodland Hills Road begins opposite the eastbound off-ramp to Exit 106. Berryhill Drive runs parallel to the eastbound lanes of I-26 and curves to the west at Exit 107. At this point, it runs generally parallel to the westbound lanes of I-20 to its intersection at Bush River Road. The intersection with Bush River Road is located approximately 300 feet west of the Exit 63 westbound ramp intersection of I-20.

Burning Tree Drive (S-32-1841/S-40-2893)/Browning Road (S-40-2892)

Burning Tree Drive begins at St. Andrews Road opposite Fernandina Road. Burning Tree Drive runs generally parallel to westbound I-26 towards Exit 107. At Center Point Road, Burning Tree Drive becomes Browning Road. Browning Road continues towards the south, crossing over I-20 and continuing parallel to the westbound lanes of I-26. As it approaches Bush River Road, Browning Road curves to the east and intersects Morninghill Drive approximately 450 feet north of the intersection of Morninghill Drive and Bush River Road. Morninghill Drive intersects Bush River Road opposite the intersection of the westbound ramps from I-26.

McSwain Drive (S-32-1814)

McSwain Drive is a frontage road that begins at Sunset Boulevard approximately 830 feet east of the SPUI interchange at Exit 110. McSwain Drive runs parallel to westbound I-26 but does not provide a connection to other frontage roads. It ends in a residential area south of the Saluda River.

2.1.5.2 I-20 Frontage Roads

There are limited frontage roads located along I-20 within the study area.

Berryhill Drive (S-32-1551)

As mentioned in the I-26 Frontage Road section, Berryhill Drive runs parallel to the westbound lanes of I-20 after it bends west from I-26. It ends at its intersection with Bush River Road approximately 300 feet west of the Exit 63 westbound ramp intersection of Bush River Road and I-20.

Garner Lane (S-40-2906)

Garner Lane is a frontage road that begins at about 380 feet from Broad River Road at its intersection with the Exit 65 eastbound on-ramp. Garner Lane runs parallel to eastbound I-20, but does not provide any other connection to other frontage roads in the study area.

2.1.5.3 I-126 Frontage Roads

There is extensive frontage road coverage along I-126 within the study area. Most of the coverage occurs east of I-126 with frontage roads running parallel to I-126 between Bush River Road and Greystone Boulevard.

Frontage Road (S-40-2891)/Lawand Drive (S-40-1019)

A frontage road begins at the I-26 westbound on-ramp from Bush River Road at Exit 108. This frontage road is a one-way pair running away from Bush River Road, becoming a two-way frontage road about 1,050 feet south of Bush River Road. The frontage road intersects and continues as Lawand Drive to its terminus at Arrowwood Road.

Arrowwood Road (S-40-287)

Arrowwood Road begins at Bush River Road and runs towards the south. At its intersection with Lawand Drive, Arrowwood Road acts as a frontage road for approximately 1,400 feet to its intersection with Gracern Road. At this intersection, Arrowwood Road turns to the east and continues to its terminus with Broad River Road.

Gracern Road (S-40-2890)

Gracern Road begins at Arrowwood Road and runs towards the south along the westbound side of I-126 towards the Greystone Boulevard interchange. Gracern Road continues approximately 1,600 feet past its intersection with Stoneridge Drive, where is bends to the north away from I-126 and terminates at Stoneridge Drive.

2.2 Purpose and Need

The primary purpose of the proposed Carolina Crossroads project is to implement a transportation solution(s) that would improve mobility and enhance traffic operations by reducing existing traffic congestion within the I-20/I-26/I-126 corridor while accommodating future traffic needs. Secondary purposes of the proposed Carolina Crossroads project are to enhance safety throughout the corridor, improve freight mobility, and improve system linkages, while minimizing community and environmental impacts.

The needs for this project were identified through a comprehensive review of previous studies along with the analysis of current data compiled for this study. This includes information in the Traffic Technical Memo and the Accident Analysis Report, as well as that collected through meetings with SCDOT; federal, state and local agencies; project stakeholders, and the public.

2.3 Conceptual Design

As described in the March 2018 *Alternatives Traffic Analysis*, analyses evaluating 2040 Build conditions for the interchanges and adjacent intersections for ten representative alternatives were completed for Level 1B screening as part of the environmental process. Through the screening process, four reasonable alternatives were progressed to Level 3 screening:

- Reasonable Alternative 1 (RA1) replaces Exit 64/Exit 107 with a Turbine Interchange, Exit 106 (St Andrews Road) with a Single Point Urban Interchange (SPUI), Exit 63 (Bush River Road) with a Diverging Diamond Interchange (DDI), Exit 65 (Broad River Road) with a SPUI, and removes access to Bush River Road at Exit 108. Colonial Life Boulevard interchange is reconfigured to a full interchange to provide access to Bush River Road from direction of I-126.
- Reasonable Alternative 5 (RA5) replaces Exit 64/Exit 107 with a Directional Interchange with 2 loops, Exit 106 with a SPUI, Exit 63 with a Partial Cloverleaf Interchange, Exit 65 with a SPUI, and removes access to Bush River Road at Exit 108. Colonial Life Boulevard interchange is reconfigured to a full interchange to provide access to Bush River Road from direction of I-126
- Reasonable Alternative 1 Modified (RA1M) is similar to RA1 with the exception of Exit 63 which is replaced with a Partial Cloverleaf Interchange.
- Reasonable Alternative 5 Modified (RA5M) is similar to RA5 with the exception of Exit 63 which is replaced with a DDI.

As documented in the DEIS, RA1 was chosen as the Refined Recommended Preferred Alternative (RRPA) and is depicted in **Figure 2-9**.

2.4 Interchange Modification Report Applicant

The interchange policy is administered by the Federal Highway Administration (FHWA). Therefore, FHWA is required to approve all new access or changes in access points pursuant to this policy.

As the owner and operator of the Interstate System, SCDOT is responsible for submitting a formal request to the FHWA in the form of an IMR that documents the analysis, the rationale for the proposed change in access, and the recommended action.

SCDOT is the sponsoring agency for the Carolina Crossroads project. The contact information for the Carolina Crossroads IMR study is provided below:

Brian Klauk, P.E.
Project Manager for Carolina Crossroads
SC Department of Transportation
955 Park St., Columbia, SC 29201

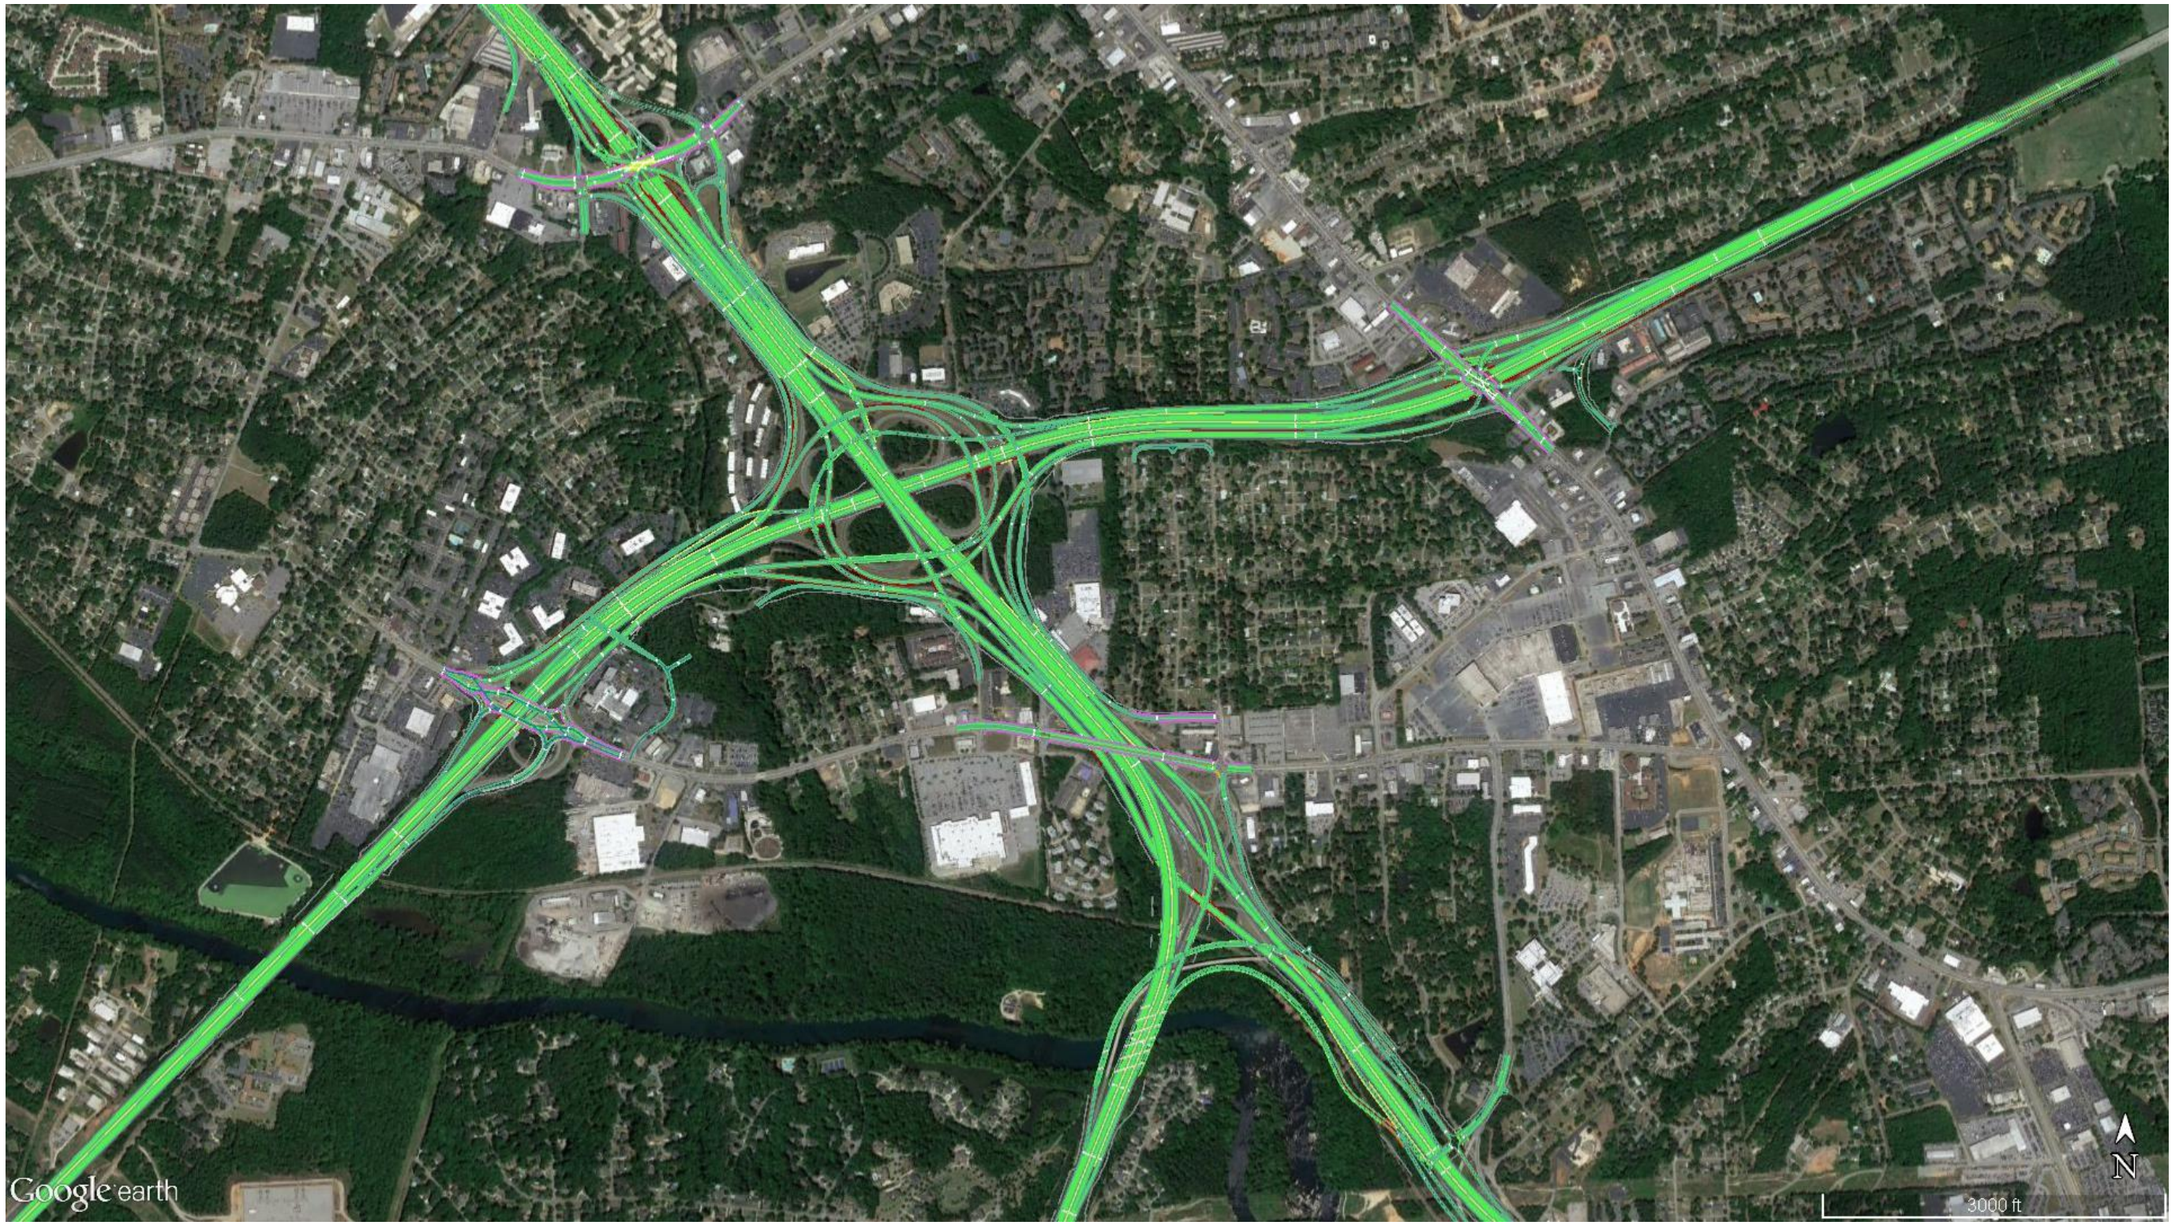

Figure 2-9 - Refined Recommended Preferred Alternative

3 Study Area

The proposed project is a transportation corridor improvement project located in Lexington and Richland counties. The project study area has been defined as a mainline corridor including I-20 from the Saluda River to the Broad River (approximately four miles), I-26 from Broad River Road to US-378 (approximately nine miles), and I-126 from I-26 to Colonial Life Boulevard (approximately one mile). **Figure 1.1** illustrates the extent of the Carolina Crossroads study area.

3.1 Demographics

According the the 2010 United State Census Bureau, Lexington County has approximately 262,500 residents and Richland County has approximately 384,500 residents. The counties have seen a steady increase in population since the 1950's. Between 2000 to 2010, Lexington County saw a 17.7% increase in population and Richland County saw a 16.6% increase in population. Select demographics including race, age, poverty and growth percentages of Lexington County and Richland County compared to the state of South Carolina are provided in **Table 3.1.**

Table 3-1 – Population Demographic

Characteristic	Population Demographic		
	South Carolina	Lexington County	Richland County
Minority Population	35.9%	23.3%	55.1%
Percent age 65 and over	14.2%	12.8%	32.5%
Percent income below poverty level	17.7%	23.1%	27.9%
Percent change in population (2000-2010)	15.3%	17.7%	16.6%

Source: U.S. Census Bureau, 2010 Demographic Profile and American Community Survey 5-year Estimates (2009-2013) Tract and Block Group data

Comparisons of the data indicate the percentage minority population in Lexington County (23.3%) is below the reported State percentage (35.9%) while the percentage minority population in Richland County (55.1%) is higher. The Lexington County population age 65 and older is slightly lower when comparing to the State percentage while the Richland County population age 65 and older percentage is more than double compared to the State percentage.

According to the South Carolina Revenue and Fiscal Affairs Office, both Lexington and Richland counties are expected to see a significant population growth by 2040. **Table 3.2** presents the population growth and projections for Lexington County and Richland County.

Table 3-2 – Population Growth

County	Population Growth				
	2000 Population	2010 Population	2040 Population	2000-2010 % Growth	2010-2040 % Growth
Lexington County	216,000	262,400	384,400	17.7%	46.5%
Richland County	320,700	384,500	464,600	16.6%	20.8%

Source: http//www.sccommunityprofiles.org/census/proj_c2010.html and DEIS. Population numbers have been rounded to the nearest hundred.

3.2 Land Use

Existing land uses immediately fronting the I-20/I-26 system interchange and the adjacent services interchanges and their arterials are predominantly mature commercial developments . A multi-family residential area is located in the northwest quadrant of the system interchange. Behind these commercial developments are established, mature single family and multi-family developments. Single family residential development is present along I-26 south of the I-26/I-126 system interchange starting at the Saluda River. The land uses transition to multi-family, commerical, and institutional as I-26 approaces Exit 110 (US 378). Along the north side of I-126, land uses are a mix of single and multi-family residential and commercial uses. To the south of I-126 and north of the Saluda River, the land use is dominated by the Riverbanks Zoo and Gardens, with a pocket of commercial uses along Candi Lane west of Greystone Boulevard.

The northwest, northeast and southeast quadrants of the I-20/I-26 and I-26/I-126 system interchanges are largely built out. There are few opportunities for additional, new development of large traffic generating land uses. The southwest quadrant of the interchange, which is bounded by Bush River Road running between Exits 63 and 108, has some undeveloped land mixed in with commercial developments and a residential subdivision. This area constitutes what is likely the largest single undeveloped area of land in the study area.

Section 3 of the I-20/I-26/I-126 Corridor Improvement Project ***DEIS*** contains additional information concerning land uses adjacent to the system and service interchanges within the larger Carolina Crossroads study area. *Figure 3.1-3 Existing land use within a half mile radius of the interchanges*, categorizes and quantifies the existing land use with a half mile radius of each of the service and system interchanges. Land uses quantified include commercial, industrial, institutional, municpal/county owned, office, parks/recreation, residential, and undeveloped. Based on this figure, the most prevalent land uses and the amount of undeveloped land adjacent to the system and service interchanges being analyzed in this study can be described as follows:

- I-20/I-26 system interchange: 47 percent residential, 25 percent commercial, 20 percent office, five percent undeveloped
- I-26/I-126 system interchange: 44 percent residential, 27 precent commercial, 19 percent industrial, two percent undeveloped
- Exit 106 (St Andrews Road): 59 percrent residential, 19 percent commercial, nine percent industrial, five percent undeveloped
- Exit 63 (Bush River Road): 35 percent residential, 28 percent commercial, 19 percent industrial, 16 percent office, one percent undeveloped

- Exit 65 (Broad River Road): 51 percent residential, 30 percent commercial, seven percent institutional, five percent undeveloped
- Colonial Life Boulevard: 42 percent residential, 35 percent undeveloped, 11 percent office.

All the interchanges, with the exception of the Colonial Life Boulevard interchange, have no more than five percent undeveloped land. The high amount of undeveloped land (35 percent) surrounding the Colonial Life interchange is due to the inclusion of the area containing the Saluda River and adjacent flood plain. It bears noting, therefore, that not all the 'undeveloped' land is necessarily able to be developed into a traffic generating land use. In this context, 'undeveloped' land has no development on it, and does not discern between developable and undevelopable land. Therefore, undevelopable land, such as the Saluda River, its floodplains, and even the land within the loop ramps at the I-20/I-26 system interchange are classified as "undeveloped".

3.3 Transportation System

The Project study area roadway transportation system is part of the Carolina Crossroads study area depicted in **Figure 1.1**. This region of Lexington and Richland counties is accessed via I-20, I-26 and I-126.

For this IMR, a focused roadway system was evaluated, centering around the I-20/I-26 and I-26/I-126 system interchanges.

External regional traffic enters and exits the network west of Exit 101 (Broad River Road), east of Exit 110 (US 378), west of Exit 61 (US 378), east of Exit 68 (Monticello Road) and east of Greystone Boulevard from Downtown Columbia. Based on the origin-destination matrices data from the microsimulation network (discussed in Section 6.1), external-to-external traffic, which includes commuting interstate traffic as well as longer distance through traffic, accounts for approximately 15 percent of the total trips within the network during the morning and afternoon peak periods.

Internal-to-internal trips account for approximately 40 percent of trips within the peak hour network. These trips are local trips having both an origin and a destination within the network. These local trips include traffic to and from arterials from the interchanges along I-20, I-26, and I-126. External-to-internal trips account for approximately 20 percent of the traffic within the network. These trips are generated outside the study area and have a destination that is reached via study area interchanges. The remaining 25% percent of the network trips are internal-to-external trips. These trips originate within the study area, access the freeway system via the interchanges and have destimations outside of the study area network.

Regional external trip ends (either origins or destinations) account for approximately 40 percent of the volume entering or exiting the network during the morning peak period. During the afternoon peak period, approximately 35 percent of volume entering or exiting the network have an external trip end.

The system-to-system interchanges process all of the external-external trips, and many of the other trip between the remaining origin-destination pairs (internal-external, external-internal, and internal-internal). Some trips with external origins or destinations may not travel through the system interchanges. Examples of such trips are those entering or exiting from the east on I-20 to/from Exit 65 (Broad River Road), and trips entering or

existing from the west on I-26 to/from the interchanges west of Exit 106 (St Andrews Road). A portion of local, internal-internal trips, such as those occuring between the I-26 interchanges west of Exit 106 (St Andrews Road) will also not travel through the system interchanges.

4 Methodology

4.1 Scenarios Analyzed

In March 2018, STV prepared the Alternatives Traffic Analysis report that incorporated the following scenarios:

- Existing Conditions
- 2040 No-Build Conditions (RA10)
- Representative Alternative 1 (RA1)
- Representative Alternative 2 (RA2)
- Representative Alternative 3 (RA3)
- Representative Alternative 4 (RA4)
- Representative Alternative 5 (RA5)
- Representative Alternative 6 (RA6)
- Representative Alternative 7 (RA7)
- Representative Alternative 8 (RA8)
- Representative Alternative 9 (RA9)
- Reasonable Alternative 1
- Reasonable Alternative 1 Modified
- Reasonable Alternative 5
- Reasonable Alternative 5 Modified

Analyses were performed for existing conditions (2015 existing traffic, intersection traffic control and geometry), No-Build conditions (2020, 2025, 2030 and 2040 traffic, and existing intersection traffic control and geometry), each of the nine Representative Alternatives (2040 traffic, and modified intersection traffic control and geometry) and the four Reasonable Alternatives (2020, 2025, 2030 and 2040 traffic and modified intersection traffic control and geometry). Additional measures of effectiveness such as mainline and arterial travel times, and external-to-external speeds/travel times were evaluated for the representative alternatives. The results of these analyses for the various alternatives were compared against one another to determine which best met the purpose and need with the least impacts and were used to help determine the RRPA for the project.

The 2040 No-Build Alternative for the I-20/I-26/I-126 System Interchange represents the existing interchange configuration, intersection traffic control and geometric conditions with no changes to those conditions which would not satisfy the purpose and need for the project. The final reasonable alternatives were selected to be moved forward in the selection process. Though traffic operations were a consideration in the evaluation of alternatives, other factors, such as construction costs, business and residential relocations, and environmental impacts were used to identify the reasonable alternatives. RA1 and RA5 were the alternatives which were identified as the reasonable alternatives from the representative alternatives. In addition, RA1 Modified and RA5 Modified were created as reasonable alternatives. The main difference between RA1 and RA1 Modified and

between RA5 and RA5 Modified was the interchange type at Exit 63, I-20 at Bush River Road. RA1 Modified included the ParClo design from RA5 and RA5 Modified included the DDI design from RA1. As documented in the DEIS, RA1 was chosen as the RRPA which will be referred to as 2040 Build RRPA.

4.2 Traffic Forecasts

Projected traffic volumes were developed using the existing traffic volume data along the mainline interstate and at the interchanges and applying a general uniform annual growth rate to those volumes to estimate 2040 morning and afternoon peak hour traffic. According to the I-20/27/77 CMP study, the AM and PM peak hour 2040 trip tables for the Columbia network were developed based on the subarea analysis of the South Carolina Statewide Model (SCSWM) trip tables. The zonal growth rates between the subarea base year and subarea future year matrices were applied to the calibrated Columbia Network existing trip tables to develop the 2040 trip tables. Any intrazonal shifts in traffic over time from the current and future year subarea matrices were distributed to ensure that the intended 2040 growth forecasts from the SCSWM were reflected in the 2040 trip tables for the peak hour operational analyses. These 2040 auto trip tables were acquired from the I-20/I-26/77 CMP study model which were then aggregated to match the Carolina Crossroads matrix developed for the Existing Conditions model. An average growth rate of 0.70 percent was then confirmed within the Carolina Crossroads study area and applied to the existing trip tables.

The 2040 peak hour traffic volumes were applied to the freeway, ramp, and intersection traffic to develop the 2040 No-Build and 2040 Build Conditions traffic volumes for use in the assessments of the interchange concepts in the Level 1A and 1B screening. The estimated 2040 volumes along the interstate and at the interchanges are contained in **Appendix B**. The trip tables developed from the CMP were used in the microsimulation analysis of the alternatives, including the reasonable alternatives and the RRPA.

4.3 Traffic Analysis

A series of capacity analyses were performed based on the methodologies and guidelines contained in the Transportation Research Board's publication **HCM 2010 Highway Capacity Manual** (HCM). Various analysis and simulation software packages, consistent with the HCM methodologies, were used in performing the analyses. These included:

- Trafficware's *Synchro* (Version 9.1.910.24)
  - Unsignalized Intersections
  - Signalized Intersections
- Caliper's *TransModeler* (Version 4.0 Build 6275)
  - Unsignalized Intersections
  - Signalized Intersections
  - Network Simulation
  - Freeway Segments
  - Weaving Segments
  - Ramp Merge/Diverge Areas

Level of Service Criteria

The analysis methodologies contained in the HCM for the various facility types and users describe the operational conditions in terms of a Level of Service (LOS). The HCM defines LOS as

"…a quality measure describing operational conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, comfort and convenience. Six LOS are defined for each type of facility that has analysis procedures available. Letters designate each level, from A to F, with LOS A representing the best operating conditions and LOS F the worst. Each level of service represents a range of operating conditions and the driver's perception of those conditions. Safety is not included in the measures that establish service levels."

The following discussions and tables describe the HCM LOS criteria for freeway segments, ramp merge/diverge areas, weaving segments, unsignalized intersections and signalization intersections.

Freeway Segments

The HCM characterizes the capacity of a basic freeway segment *"…by three performance measures: density in passenger cars per mile per lane (pc/mi/ln), space mean speed in miles per hour (mi/h), and the ratio of demand flow rate to capacity (v/c). Each of these measures is an indication of how well traffic is being accommodated by the basic freeway segment."* **Table 4-1** shows the HCM LOS criteria for basic freeway segments. LOS F occurs when either the segment density exceeds 45 pc/mi/ln or when the segment v/c ratio exceeds 1.0 (regardless of the segment density).

Table 4-1 - Freeway Segment LOS Criteria

Basic Freeway Segments	
LOS	**Density (pc/mi/ln)**
A	< 11
B	> 11-18
C	> 18-26
D	> 26-35
E	> 35-45
F	> 45 v/c > 1.0

Weaving Segments

Weaving segments occur where two or more streams of traffic traveling in the same direction are able to cross each other without traffic control devices. This typically occurs where a merge area is followed by a diverge area within a relative short distance (usually less than 2,800 feet). The LOS of a weaving segment is also related to the

density of the segment. Regardless of the density, the weaving segment is considered to operate at LOS F when the v/c exceeds 1.0. **Table 4-2** shows the HCM LOS criteria for Freeway Weaving Segments.

Table 4-2 - Weaving Segment LOS Criteria

Freeway Weaving Segments	
LOS	Density (pc/mi/ln)
A	< 10
B	> 10-20
C	> 20-28
D	> 28-35
E	> 35
F	v/c > 1.0

Ramp Merge and Diverge Areas

Ramp-freeway junctions occur when merging maneuvers occur (on-ramps) or when diverging maneuvers occur (off-ramps). The operation of these merge and diverge areas are affected by several factors, including the operation of the adjacent freeway segment and the proximity and flow on adjacent ramps. Typically, the influence area of the ramps is 1,500 feet upstream of a diverge point and downstream from a merge point. As with freeway segments and weaving segments, the LOS of a merge or diverge area is related to the density of the segment. Regardless of the density, the merge or diverge areas are considered to operate at LOS F when the freeway demand exceeds the capacity of the upstream freeway segment (at diverge areas) or the downstream freeway segment (at merge areas), as well as when the ramp demand exceeds the ramp capacity. **Table 4-3** shows the HCM LOS criteria for Ramp Merge and Diverge areas.

Table 4-3 - Merge/Diverge LOS Criteria

Ramp Merge and Diverge Areas	
LOS	Density (pc/mi/ln)
A	< 10
B	> 10-20
C	> 20-28
D	> 28-35
E	> 35
F	v/c > 1.0

Unsignalized Intersections

The LOS for unsignalized intersections is based on the average control delay per vehicle. Since major street traffic is seldom controlled by STOP signs (except at intersections with ALL-WAY STOP control or in special circumstances), major street traffic generally will experience virtually no delay. Most of the delay will be

encountered by traffic on approaches controlled by STOP signs. Under certain conditions, delay will also be encountered by left turning traffic on the major street waiting for appropriately sized gaps in the opposing traffic flow to complete their turn. Therefore, the delay experienced by STOP controlled movements and major street left turns, rather than the entire average intersection delay, are used to identify the critical LOS at these intersections. **Table 4-4** shows the HCM LOS criteria for unsignalized intersections.

Table 4-4 - Unsignalized Intersection LOS Criteria

Unsignalized Intersections	
LOS	**Control Delay (sec/vehicle)**
A	< 10
B	> 10-15
C	> 15-25
D	> 25-35
E	> 35-50
F	> 50

Signalized Intersections

The LOS for signalized intersections is based on the average control delay per vehicle. LOS can be identified for the entire intersection, individual intersection approaches, and each movement/lane-group. **Table 4-5** shows the HCM LOS criteria for signalized intersections.

Table 4-5 - Signalized Intersection LOS Criteria

Signalized Intersections	
LOS	**Control Delay (sec/vehicle)**
A	< 10
B	> 10-20
C	> 20-35
D	> 35-55
E	> 55-80
F	> 80

5 Traffic Volumes

The traffic volumes used in the analysis for the I-20/I-26/I-126 System Interchange consisted of Existing (2015) conditions, and Future (2020, 2025, 2030 and 2040) No-Build and Build Conditions.

5.1 Existing Traffic Volumes

Extensive traffic data collection was performed as part of the Carolina Crossroads project. The data collection effort is summarized in a separate technical report *Traffic Data Collection, Carolina Crossroads*. Data that was collected included vehicle classification/volume counts at the I-20/I-26/I-126 system interchanges, ramp termini turning movement counts, data from mainline Automatic Traffic Recorders (ATR), and regional and ramp-to-ramp origin-destination information.

Additional turning movement count data was collected by SCDOT to extend coverage to include certain intersections adjacent to the ramp termini intersections where the original turning movement counts were collected. Collecting data at these adjacent intersections allowed for accurate traffic volumes to be used in preparing the arterial interchange and the overall network microsimulation models.

A review of the combined turning movement count and system interchange counts indicated that the system-wide morning peak hour was 7:30 to 8:30 AM and the system-wide afternoon peak hour was 4:45 to 5:45 PM. At the system ramps, the morning peak hour was found to be between 7:00 and 8:00 AM, while the afternoon peak hour was found to be 4:00 to 5:00 PM. The design peak hours used for this study was 7:15 to 8:15 AM and 4:45 to 5:45 PM, consistent with the I-20/27/77 CMP Study, and was based on a combination of the turning movement peak hour data collected in 15-minute intervals and the ramp-termini volumes collected in 60-minute intervals.

The collected ATR data, generally covering the period between January 1, 2014 and January 31, 2015, was used to determine the directional freeway volumes by balancing freeway segment volumes selected at an ATR station through the network by adding and subtracting ramp volumes entering and exiting the freeways via service interchange ramps. Mainline volume data derived from the ATR were combined with the system ramp volumes and the turning movement ramp peak hour volumes to develop existing balanced traffic volumes for the study area.

The existing balanced interstate peak hour volumes were based on the 10th highest hour volumes at selected ATR stations. Volumes throughout the network were then determined using volume data collected at the system interchange ramps and turning movement counts at the ramp terminal intersections. The balanced volumes, along with additional turning movement count data at adjacent intersections, were used to establish the observed volumes used during the calibration process of the existing TransModeler network. The calibration of the existing TransModeler network included comparisons of queues observed in the model simulations to field observations of interstate and ramp queuing, local knowledge and familiarity with recurring traffic conditions within the corridor. The existing balanced interstate volumes for Existing Conditions network are also contained in **Appendix A**.

5.2 2040 Traffic Volumes

Two methods were used to develop traffic projections that were applied to elements of the RA development and to the microsimulation of each RA. The first method involved the use of historic traffic data to estimate system-wide annual growth rates to be applied against existing traffic. The second method involved the use of origin-destination data collected as part of the Carolina Crossroads data collection and developed into regional trip tables used in the microsimulation model.

Previously collected existing traffic volume data were used as the basis for the development of the future traffic projections used in the preliminary screening of interchange Accessory Options (AO) and for high level assessment of freeway ramps, and in the microsimulation model network. Traffic projections used to estimate 2040 traffic volumes was based on changes to historic annual average daily traffic (AADT) volumes obtained from SCDOT and from growth forecasts in the South Carolina Statewide Model (SCSWM).

Projected traffic volumes were developed using the existing peak hour volumes along the mainline interstate and at the interchanges and applying a general uniform annual growth rate to those volumes to estimate 2040 morning and afternoon peak hour traffic. For the purposes of the traffic volume projections, a 0.70 percent annual growth rate was used to estimate 2040 peak hour traffic volumes. The 2040 peak hour traffic volumes were applied in the generalized interstate/interchange capacity screenings used to develop the individual RA from a range of prospective AO at each interchange. The 2040 volumes along the interstate and at the interchanges from the TransModeler 2040 No-Build network are contained in **Appendix B**.

6 Traffic Operations

6.1 TransModeler Network Analysis

TransModeler 4.0, a microsimulation software, was used to analyze the Existing, No-Build, and Build alternative freeway networks and interchange operations. A TransModeler microsimulation model consists of a large component database and executable files that are run through the TransModeler software. One single project file is comprised of network files, traffic control and signal timing plans, vehicle detector layout and configuration, trip tables for both autos and trucks, traffic volumes, and driver/roadway parameter files. This section discusses the development of the existing network based on collected O-D and traffic count data.

The Carolina Crossroads TransModeler network was developed based on a larger, regional network developed as part of the I-20/I-26/77 Corridor Management Plan (CMP) Study. The CMP study included a calibrated TransModeler model comprised of 110 miles of interstate and freeway, including six system interchanges and 43 service interchanges, in addition to 70 miles of highway, arterial, and local streets. The CMP network, which included the full project limits of the Carolina Crossroads study area, was used to develop the existing Carolina Crossroads microsimulation network. Once the CMP model was reviewed, the Carolina Crossroads network was extracted. A more detailed review was then conducted to assess the operations of the study area. Additional intersections were added and input volumes were verified and adjusted based on existing traffic count data to better define the existing network. A more detailed discussion of how the Carolina Crossroads network was developed can be found in the *Alternatives Traffic Analysis: Carolina Crossroads I-20/I-26/I-126 Corridor Project*.

FHWA generally prefers the use of McTrans' Highway Capacity Software (HCS) in the assessment of freeway operations (freeway segments, merge/diverge area, and weaving sections). There are several limitations of using HCS, which is a macroscopic, deterministic model that uses HCM Methodologies. The HCS analysis may show differing conditions than existing operations and conditions in the field because it does not consider upstream and downstream traffic impacts and is unable to model interactions between the two. The HCS model is essentially a spot check at a certain location; metering of upstream traffic and queuing resulting from congested downstream operations are not considered and will have no effect on the generated analysis. This is not the case for actual conditions, as upstream and downstream congestion may have direct impacts at a specific segment, causing a ripple effect throughout the network. HCS is also limited in its application in evaluating extremely complex weaving sections, such as those encountered in each direction on I-26 between the Exit 106 service interchange and the Exit 107 system interchange.

TransModeler is a microscopic behavior-based multi-purpose traffic simulation program that takes into consideration vehicle interaction and driver behaviors, as well as the operational impacts for both the upstream and downstream traffic conditions and can measure traffic densities on each segment and lane. For these reasons, TransModeler was used to assess all the freeway segments, merge/diverge areas, and weaving sections instead of HCS.

The design files for each of the Representative Alternatives were converted to KMZ files and imported as a background into the TransModeler microsimulation network. The existing TransModeler network was modified

to match the geometry of the KMZ files while maintaining all the external nodes and centroids of the existing network. Therefore, the same origin-destination trip tables were used for each of the alternatives. After updating the geometry to match the design of the representative alternatives, intersection controls were added for the new geometry. Where necessary, Synchro was utilized to develop basic traffic signal timing plans at the signal-controlled intersections.

A simulation-based, Dynamic Traffic Assignment (DTA) was utilized in TransModeler to create travel paths and assign demand volumes across the network for each of the Representative Alternatives. It is reasonable to assume that simulation models using DTA are better predictors of congested networks and may achieve enhanced results than a static traffic assignment method. With each DTA iteration, TransModeler will compute a relative gap between the previous iteration and an equilibrium solution. The DTA was run for 100 iterations with a goal of reaching a relative gap of 0.001. Each model was not able to converge due to the congestion, especially outside the project limits. Additional adjustments were made to the path assignments to remove unreasonable paths created by the DTA. It was assumed that RA10 (No-Build) network path assignments would be consistent with those from the Existing conditions. Therefore, a DTA was not utilized in the analysis of RA10. 2040 RRPA volumes from the TransModeler analysis are summarized in Appendix B.

The final TransModeler analyses for existing conditions, 2040 No-Build conditions, and 2040 Build RRPA conditions were performed using TransModeler 4.0 Build 6275. The existing conditions scenario includes the existing number of freeway lanes present on the segments within the study area. The 2040 No-Build conditions and 2040 Build RRPA conditions included additional freeway capacity added as part of the I-20 Widening Project (Mile Markers 49-60) and the I-26 Widening Project (Mile Markers 85 – 101) just outside of the study area. The following analysis was conducted to assess the existing and future operations of the I-20/I-26/I-126 study area:

- Freeway segment and ramp merge/diverge area operations analysis
- Signalized and unsignalized intersection analysis
- Signalized and unsignalized queuing analysis (RRPA only)

6.2 Freeway Segment Analyses

The freeway, merge and diverge densities for the I-26, I-20 and I-126 segments were obtained from the TransModeler microsimulation output files, which include an average of ten (10) runs. In calculating density, TransModeler determines the segments and lanes within the influence area for freeway, weaving, merge, and diverge analysis based on roadway classification. The HCM methodology is applied, considering only the vehicles within the influence area. The weaving sections are identified within the basic freeway, merge and diverge area analysis.

Each simulation was run for one hour with a 30-minute warm up time. Similar to the CMP Network, the network was pre-loaded prior to the 30-minute warm up time which simulates peak period congestion.

It should be noted that due to the high demand volumes, the network was not able to accommodate the demand volume in both the Existing and No-Build simulations. Extensive queuing was observed outside of the network at the freeway entry points, particularly in the 2040 No-Build scenario, at the end of the peak hour simulation during both the morning and afternoon peak hours.

The basic freeway, weaving, merge and diverge area analysis outputs for the Existing Conditions, 2040 No-Build conditions and the 2040 Build RRPA conditions are provided in **Appendix C** and a summary of results is shown in **Table 6-1** through **Table 6-9**.

The analysis results for the freeway segment analysis for the Existing Conditions, summarized in the **Table 6-1**, **Table 6-2** and **Table 6-3**, indicate the following:

- During the morning peak hour:
  - I-26 eastbound freeway segments between Exit 104 (Piney Grove Road) and Exit 107 operate at LOS F. All other segments along I-26 eastbound operate at LOS D or better
  - All I-26 westbound segments operate at LOS D or better.
  - I-20 eastbound freeway segment east of Exit 65 (Broad River Road) operates at LOS E, while other I-20 eastbound segments operate at LOS D or better.
  - I-20 westbound segment between Exit 65 (Broad River Road) and Exit 64 operate at LOS E, while other I-20 westbound segments operate at LOS D or better.
  - All I-126 eastbound freeway segments during the morning peak hour operate at LOS D or better.
  - All I-126 westbound freeway segments during the morning peak hour operate at LOS C or better.
- During the afternoon peak hour:
  - I-26 eastbound freeway segments between Exit 104 (Piney Grove Road) and Exit 106 (St Andrews Road), and between Exit 107 and Exit 108 (weaving) operate at LOS E, while the freeway segments from the I-126 diverge to Exit 110 (US 378) operate at LOS F. All other I-26 eastbound freeway segments operate at LOS D or better.
  - I-26 westbound freeway segments operate at LOS F from the I-26/I-126 merge to Exit 104 (Piney Grove Road). All other I-26 westbound segments operate at LOS D or better.
  - All I-20 eastbound freeway segments operate at LOS D or better.
  - I-20 westbound freeway segments east of Exit 65 (Broad River Road) to Exit 63 (Bush River Road) operate at LOS F, while the westbound segment between Exit 63 and Exit 61 (US 378) operates at LOS D.
  - All I-126 eastbound freeway segments operate at LOS B.
  - All I-126 westbound freeway segments operate at LOS F.

With traffic volumes projected to increase at an annual rate of 0.70 percent per year, and with no increase in freeway capacity within the IMR study area or modification to the system interchange, the increased traffic volumes traveling on I-26, I-20 and I-126 will result in increased density and reduce freeway segment LOS under 2040 No-Build conditions. The analysis results for the freeway segment analysis for the 2040 No-Build, summarized in the **Table 6-1**, **Table 6-2** and **Table 6-3**, indicate the following:

- During the morning peak hour:
  - All I-26 eastbound freeway segments operate at LOS E and F.

  - All I-26 westbound freeway segments operate at LOS D or E.
  - I-20 eastbound freeway segments from west of Exit 61 (US 378) to Exit 63 (Bush River Road) operate at LOS F, and the eastbound segment east of Exit 65 (Broad River Road) operates at LOS E. All other I-20 eastbound segments operate at LOS D or better.
  - I-20 westbound segments from east of Exit 65 to Exit 63 operate at LOS F. I-20 westbound freeway segment between Exit 63 and Exit 61 operates at LOS C.
  - All I-126 eastbound freeway segments during the morning peak hour operate at LOS D or better.
  - All I-126 westbound freeway segments during the morning peak hour operate at LOS C or better.
- During the afternoon peak hour:
  - All I-26 eastbound freeway segments operate at LOS F, except the eastbound segment east of Exit 110 (US 378) which operates at LOS C.
  - All I-26 westbound freeway segments operate at LOS F.
  - I-20 eastbound freeway segment between Exit 64 and Exit 65 operates at LOS F. All other eastbound segments operate at LOS D or better.
  - I-20 westbound freeway segments east of Exit 65 to Exit 63 operate at LOS F, while the westbound segment between Exit 63 and Exit 61 operates at LOS D.
  - All I-126 eastbound freeway segments operate at LOS B.
  - All I-126 westbound freeway segments operate at LOS F.

The increased capacity provided by the RRPA will result in generally better LOS in the morning and afternoon peak hours compared to the Existing Conditions, and improved LOS over the 2040 No-Build conditions. With improved throughput volume within the system-to-system interchange, the RRPA design pushes more volume along the freeway mainlines which may result in increased density to mainline segments not modified under Build conditions. In addition, the RRPA proposes I-26 and I-20 mainline collector-distributor roads to separate the closely spaced exit ramps resulting in a shift of volume from mainline to the frontage road systems. The analysis results for the freeway segment analysis for the 2040 Build RRPA Conditions, summarized in the **Table 6-1**, **Table 6-2** and **Table 6-3**, indicate that:

- During the morning peak hour:
  - The I-26 eastbound freeway segment between Exit 107 to the I-126 exit operates at LOS E due to the downstream congestion from the I-26/I-126 split and volume traveling in the right-most lanes in anticipation of the system diverge towards Downtown Columbia. The average speed reported along this segment is greater than 40 mph. All other I-26 eastbound segments operate at LOS D or better.
  - All I-26 westbound freeway segments operate at LOS D or better.
  - The I-20 eastbound freeway segment east of Exit 65 (Broad River Road) operates at LOS F due to capacity constraints downstream of the project limits. However, as traffic merges down to three lanes prior to the bridge over the Broad River, the average speed along I-20 eastbound is greater than 50 mph while the average speed along the CD road is less than 20 mph. All other eastbound segments operate at LOS D or better.
  - All I-20 westbound freeway segments operate at LOS D or better.
  - The I-126 eastbound freeway segment between Colonial Life Boulevard and Greystone Boulevard operates at LOS E this is the result of increased segment density due to improved throughput volume from the system-system interchange congestion downstream of project

limits toward downtown Columbia. An acceptable average speed is maintained at 54 mph. The eastbound segment from I-26 to Colonial Life Blvd operates at LOS D.
    - All I-126 westbound freeway segments operate at LOS B.
- During the afternoon peak hour:
    - All I-26 eastbound freeway segments operate at LOS C.
    - The I-26 westbound freeway segment between Exit 106 (St Andrews Road) and Exit 104 (Piney Grove Road) operates at LOS F due to increased density resulting from increased volume throughput. The average speed along this segment is greater than 40 mph. All other westbound freeway segments operate at LOS D or better.
    - The I-20 eastbound freeway segment east of Exit 65 (Broad River Road) operates at LOS E due to capacity constraints downstream of the project limits, while all other eastbound segments operate at LOS B or better. The I-20 eastbound average speed east of Exit 65 is greater than 55 mph.
    - The I-20 westbound segments east of Exit 65 operate at LOS E with an average speed of greater than 40 mph. The I-20 westbound segment between Exit 63 (Bush River Road) and Exit 61 (US 378) operate at LOS F, with an average speed of less than 20 mph due to downstream congestion resulting from capacity constraints just west of the project limits. With the capacity constraints removed between Exit 63 and Exit 61, average speed is greater than 40 mph. All other westbound segments operate at LOS A.
    - I-126 eastbound freeway segments operate at LOS B or better.
    - All I-126 westbound freeway segments operate at LOS D.

Heavy queuing and ramp backups along I-20 eastbound were identified at the eastern project limits during the AM peak hour and along I-20 westbound between Exit 63 (Bush River Road) and Exit 61 (US 378) during the PM peak hour. Additional simulation runs were made to assess the need to include an additional upstream merge location from the eastbound CD road prior to Exit 65. These additional simulation runs indicated the congestion and queue backup observed along I-20 eastbound was due to the capacity constraints created by the transitioning of the four-lane freeway section into the existing three lane section at the Broad River Bridge just east of Exit 65(Broad River Road). With the removal of the capacity constraints, the merge from the eastbound CD road functions acceptably and no additional upstream merge location should be necessary.

The heavy queuing along I-20 westbound was due to the capacity constraints created by the transitioning of the four-lane freeway section into the existing three lane section prior to the Exit 61 (US 378) interchange in addition to Exit 61 westbound off-ramp spillback onto the mainline. With these capacity constraints opened, acceptable LOS is obtained within the RRPA design. **Attachment D** includes a summary of the basic freeway density with the capacity restraints removed outside of project limits along I-20, in addition to average peak hour speeds for all freeway segments for the RRPA externally constrained and unconstrained.

6.3 Freeway Merge Area Analyses

The analysis results for the ramp merge areas for Existing Conditions, summarized in **Table 6-4**, **Table 6-5** and **Table 6-6**, indicate the following:

- During the morning peak hour:
  - I-26 eastbound merge areas between Exit 101 (Broad River Road) and Exit 107 operate at LOS F. All other eastbound merge areas operate at LOS D or better.
  - I-26 westbound merge areas operate at LOS D or better.
  - I-20 eastbound merge areas operate at LOS D or better.
  - I-20 westbound merge areas operate at LOS D or better except for Exit 65 (Broad River Road), where the merge area operates at LOS E.
  - I-126 eastbound merge area operates at LOS C.
  - I-126 westbound merge area operates at LOS B.
- During the afternoon peak hour:
  - I-26 eastbound merge areas of Exit 108 and Exit 108 (I-126) operate at LOS F, while the merge area of Exit 107 (weaving) operates at LOS E. All other eastbound merge areas operate at LOS D or better.
  - I-26 westbound merge areas better Exit 108 (I-126) and Exit 107 operate at LOS F. The merge area of Exit 106 (St Andrews Road) operates at LOS E. Exit 110 merge area operates at LOS B.
  - I-20 eastbound merge areas operate at LOS C or better.
  - I-20 westbound merge areas operate at LOS C, except Exit 65 (Broad River Road) and Exit 64 merge areas which operate at LOS F.
  - I-126 eastbound merge area operates at LOS B.
  - I-126 westbound merge area operates at LOS C.

With traffic volumes projected to increase at an annual rate of 0.70 percent per year, and with no increase in freeway capacity or modification to the system interchange, the increased traffic volumes traveling on I-26, I-20 and I-126 will results in increased density and reductions of merge area LOS under 2040 No-Build conditions. The analysis results for the ramp merge areas for 2040 No-Build Conditions, summarized in **Table 6-4**, **Table 6-5** and **Table 6-6**, indicate the following:

- During the morning peak hour:
  - I-26 eastbound merge areas between Exit 104 (Piney Grove Road) and Exit 107 operate at LOS F, while the Exit 108 merge area operates at LOS E. All other eastbound ramp merge areas operate at LOS C or better.
  - I-26 westbound merge areas of Exit 108 (I-126) and Exit 107 operates at LOS E. All other westbound ramp merge areas operate at LOS D or better.
  - I-20 eastbound merge areas of Exit 61 (US 378) operate at LOS F. Exit 65 (Broad River Road) and Exit 64 loop ramp merge areas operate at LOS E. All other eastbound ramp merge areas operate at LOS C.
  - I-20 westbound merge areas of Exit 65 (Broad River Road) and Exit 64 operate at LOS F All other westbound ramp merge areas operate at LOS C or better.
  - All I-126 merge areas operate at LOS B.
- During the afternoon peak hour:

- I-126 eastbound merge area operates at LOS C.
- I-126 westbound merge area operates at LOS A.
- I-26 westbound merge areas between Exit 110 (US 378) and Exit 107 operate at LOS F. The Exit 106 (St Andrews Road) merge area operates at LOS E.
- I-20 eastbound merge areas of Exit 64 and Exit 64 Loop operate at LOS F and LOS E, respectively. All other ramp merge areas operate at LOS D or better.
- I-20 westbound merge areas of Exit 65 (Broad River Road) and Exit 64 operate at LOS F All other westbound ramp merge areas operate at LOS C.
- I-126 eastbound merge area operates at LOS B.
- I-126 westbound merge area operates at LOS F.

The additional capacity provided by the RRPA will result in generally better LOS in the morning and afternoon peak hours compared to the Existing Conditions, and improved LOS over the 2040 No-Build conditions. With improved throughput volume within the system-to-system interchange, the RRPA design pushes more volume along the freeway mainlines which may result in increased density and worse levels of service in merge areas not modified under Build conditions. In addition, the RRPA includes I-26 and I-20 mainline collector-distributor roads to separate the closely spaced exit ramps resulting in a decrease in the number of merge ramps along I-26 and I-20. The 2040 Build RRPA Conditions analysis results, summarized in **Table 6-4**, **Table 6-5** and **Table 6-6**, indicate that:

- During the morning peak hour:
  - I-26 eastbound merge area of Exit 106 (St Andrews Road) operates at LOS E due to the downstream congestion at the I-26/I-126 split. The average speed at this merge area is above 35 mph. All other eastbound ramp merge areas operate at LOS C or better.
  - All I-26 westbound merge areas operate at LOS C or better.
  - I-20 eastbound merge areas of the CD Road and Exit 65 (Broad River Road) operate at LOS F due to capacity constraints downstream of the project limits. As traffic merges down to three lanes prior to the bridge over the Broad River, the average speed along I-20 eastbound in this merge area is between 10-20 mph. With the capacity constraints removed between Exit 65 (Broad River Road) and Exit 68 (Monticello Road), average speed increases to greater than 40 mph and the CD Road merge area operates at LOS C, while the Exit 65 merge area operates at LOS E. The Exit 61 merge area operates at LOS D.
  - All I-20 westbound merge areas operate at LOS B or better.
  - I-126 eastbound merge area from the I-20 ramp operates at LOS E due to existing congestion downstream of project limits toward downtown Columbia. The average speed at this merge area is greater than 40 mph. The Colonial Life Blvd merge area operates at LOS D.
  - I-126 westbound merge areas operate at LOS B or better.
- During the afternoon peak hour:
  - All I-26 eastbound merge areas operate at LOS C or better.
  - I-26 westbound merge areas of Exit 107 and Exit 106 (St Andrews Road) operate at LOS E due to increased volume and downstream congestion between Exit 104 (Piney Grove Road) and Exit 106. The average speed at these merge areas are greater than 40 mph. All other westbound merge areas operate at LOS C.
  - All I-20 eastbound merge areas operate at LOS D or better

- I-20 westbound merge areas of the CD Road and Exit 63 (Bush River Road) operate at LOS F with an average speed of 20 mph, due to downstream congestion and capacity constraints just west of the project limits. With the capacity constraints removed between Exit 63 (Bush River Road) and Exit 61 (US 378), the average speed is greater than 55 mph around these merge areas. The Exit 65 (Broad River Road) merge area operates at LOS A.
- I-126 eastbound merge areas operate at LOS C or better.
- I-126 westbound merge areas operate at LOS D or better.

As part of this analysis, the Exit 61 eastbound on-ramp acceleration lane was extended as an added lane to increase capacity and reduce congestion identified in the analysis. However, the Exit 61 (US 378) westbound off-ramp, outside of the project limits, may substantially affect the westbound mainline density and Exit 63 (Bush River Road) westbound merge operations due to high ramp volumes and congestion identified along US 378 at Exit 61. An extension of the Exit 61 off-ramp and/or increasing capacity to a two-lane off ramp outside of this project may keep the ramp queues from spilling back to the mainline and improve the reported density within the study area.

As mentioned in the freeway segment analysis, increased volumes and improved volume throughput within the system-to-system interchange resulted in heavy queuing and ramp backup along I-20 eastbound which affected the eastbound merge area at Exit 65 and the CD Road merge. The need to include an additional upstream merge location for the CD road prior to Exit 65 was considered and assessed. However, the congestion at the eastbound merge area at Exit 65 was due to the capacity constraints at the project limit transition at the Broad River crossing just east of Exit 65. With the capacity constraints removed, the congestion decreases so an acceptable LOS is obtained within the RRPA design without an additional upstream merge from the CD road. **Attachment D** includes a summary of the merge density with the capacity restraints removed outside of project limits along I-20, in addition to average peak hour speeds for all merge areas for the RRPA externally constrained and unconstrained.

Also, it should be noted that the Greystone Boulevard Interchange merge area along I-126 westbound operates at an acceptable LOS during both the morning and afternoon peak hours as shown in the table below. The distance between the Colonial Life Blvd westbound off-ramp and the Greystone Boulevard westbound on-ramp is sufficient and will not affect ramp operations.

6.4 Freeway Diverge Area Analyses

The analysis results for the ramp diverge areas for Existing Conditions, summarized in **Table 6-7**, **Table 6-8** and **Table 6-9**, indicate the following:

- During the morning peak hour:
  - I-26 eastbound diverge areas between Exit 104 and Exit 110 operate at LOS F. The Exit 110 diverge area operates at LOS D.
  - I-26 westbound diverge areas operate at LOS D or better.
  - I-20 eastbound diverge area of Exit 63 operates at LOS F. All other eastbound diverge areas operate at LOS D or better.
  - I-20 westbound diverge area of Exit 64 operates at LOS E. All other westbound diverge areas operate at LOS B.
  - I-126 eastbound diverge area operates at LOS B.
  - I-126 westbound diverge areas operate at LOS B.
- During the afternoon peak hour:
  - I-26 eastbound diverge areas between Exit 104 and Exit 108 operate at LOS D or E, while the diverge area of Exit 110 operates at LOS F.
  - I-26 westbound diverge areas between Exit 108 and the Exit 106 loop operate at LOS F, while the diverge area of Exit 104 operates at LOS E. Exit 110 diverge area operates at Exit 110.
  - I-20 eastbound diverge areas operate at LOS C or better.
  - I-20 westbound diverge areas of Exit 65, Exit 64 and Exit 63 operate at LOS F, while Exit 61 operates at LOS E. All other westbound diverge areas operate at LOS C.
  - I-126 eastbound diverge area operates at LOS B
  - I-126 westbound diverge area to I-26 westbound operates at LOS F, while all other diverge areas operate at LOS D or better.

With traffic volumes projected to increase at an annual rate of 0.70 percent per year, and with no increase in freeway capacity or modification to the system interchange, the increased traffic volumes traveling on I-26, I-20 and I-126 will results in increased density and reductions of diverge area LOS. The analysis results for the ramp diverge areas for 2040 No-Build Conditions, summarized in **Table 6-7**, **Table 6-8** and **Table 6-9**, indicate the following:

- During the 2040 No-Build morning peak hour:
  - All I-26 eastbound diverge areas operate at LOS F.
  - I-26 westbound diverge area of Exit 110 (US 378) operates at LOS F. I-26 westbound diverge areas between Exit 106 (St Andrews Road) and Exit 104 (Piney Grove Road) operate at LOS E. All other westbound ramp diverge areas operate at LOS D.
  - I-20 eastbound diverge areas of Exit 63 (Bush River Road) and Exit 64 operate at LOS F and LOS E, respectively. All other eastbound diverge areas operate at LOS C.
  - I-20 westbound diverge area of Exit 64 and Exit 63 (Bush River Road) operates at LOS F. All other westbound diverge areas operate at LOS D or better.
  - I-126 eastbound diverge area operates at LOS B.
  - I-126 westbound diverge areas operate at LOS B or better.
- During the afternoon peak hour:

- All I-26 eastbound diverge areas operate at LOS F.
- All I-26 westbound diverge areas operate at LOS F.
- I-20 eastbound diverge area (weaving) of the Exit 64 loop operates at LOS E, while the eastbound Exit 63 (Bush River Road) diverge area operates at LOS F. All other eastbound ramp diverge areas operate at LOS D.
- All I-20 westbound diverge areas operate at LOS F, except Exit 64 loop diverge (weaving) area which operates at LOS C.
- I-126 eastbound diverge area operates at LOS B.
- I-126 westbound diverge areas operate at LOS F.

The additional capacity provided by the RRPA will result in generally better LOS in the morning and afternoon peak hours compared to the Existing Conditions, and improved LOS over the 2040 No-Build conditions. In addition, the RRPA proposes I-26 and I-20 mainline collector-distributor roads to separate the closely spaced exit ramps resulting in a decrease in the number of diverge ramps along I-26 and I-20. The 2040 Build RRPA analysis results, summarized in **Table 6-7**, **Table 6-8** and **Table 6-9**, indicate that:

- During the morning peak hour:
  - I-26 eastbound diverge area of the CD Road operates at LOS F due to the increased volume processed by the RRPA, resulting in increased congestion accessing I-20. In addition, the volume now traveling in the right-most lanes in anticipation of the system diverge towards Downtown Columbia causes additional queuing at this diverge area. The diverge area of the I-26/I-126 split operates at LOS E due to the weaving conflicts between the Exit 106 (St. Andrews Road) eastbound on-ramp and the volume exiting to I-126 eastbound. This is caused by the majority of traffic traveling to downtown Columbia that now exit to the right to access I-126. The average speed at the CD Road diverge area is less than 25 mph while average speed at the I-26/I-126 split diverge is less than 40 mph. This diverge area is expected to operate at an acceptable LOS at opening year (2020) and projected to be operating at a failing LOS by 2025. All other eastbound ramp diverge areas operate at LOS C.
  - I-26 westbound diverge area of Exit 110 (US 378) operates at LOS F with an average speed of greater than 30 mph. All other westbound diverge areas operate at LOS C or better.
  - I-20 eastbound diverge area of the CD road area operates at LOS D.
  - I-20 westbound diverge area of Exit 61 (US 378) operates at LOS E due to westbound off-ramp spill back from Exit 61 congestion and other network capacity constraints outside the study area. With the capacity constraints removed, the diverge area operates at LOS D at Exit 61. All other westbound diverge areas operate at LOS D or better.
  - I-126 eastbound diverge areas operate at LOS D.
  - I-126 westbound diverge areas operate at LOS B or better.
- During the afternoon peak hour:
  - All I-26 eastbound diverge areas operate at LOS C or better.
  - I-26 westbound diverge area of Exit 104 (Piney Grove Road) operates at LOS F due to the increased volume processed by the RRPA, resulting in congestion. The average speed of the diverge area is greater than 40 mph. All other diverge areas operate at LOS D or better.
  - I-20 eastbound diverge area of the CD road area operates at LOS B.
  - I-20 westbound merge areas operate at LOS B or better except for Exit 65 (Broad River Road) and Exit 61 (US 378) diverge areas, which operate at LOS F due to westbound off-ramp spill back

from Exit 61 and capacity constraints outside of the project area. The average speed at the diverge area of Exit 61 is less than 25 mph. With the capacity constraints removed along I-20 westbound, the Exit 61 diverge area will continue to operate at LOS F due to US 378 arterial queuing that extends onto the mainline.

- I-126 eastbound diverge areas operate at LOS B.
- I-126 westbound diverge areas operate at LOS D or better.

As part of this project the Exit 110 off-ramp was lengthened and the diverge area was relocated to keep the off-ramp queues from spilling back to the mainline. The spacing between the relocated diverge area and merge area (from I-126 westbound fly-over ramp) has been shortened to about 2,500 feet which is sufficient and will not adversely affect mainline and ramp operations. The Exit 61 westbound off-ramp, outside of the project limits, may substantially affect the westbound mainline density and Exit 63 westbound merge operations due to high ramp volumes and congestion identified along the Exit 61 arterial. **Attachment D** includes a summary of the basic freeway density with the capacity restraints removed outside of project limits along I-20, in addition to average peak hour speeds for all diverge areas for the RRPA externally constrained and unconstrained.

Also, it should be noted that the Greystone Boulevard Interchange diverge area along I-126 eastbound operates at an acceptable LOS during both the morning and afternoon peak hours as shown in the table below. The distance between the Colonial Life Blvd eastbound on-ramp and the Greystone Boulevard eastbound off-ramp is sufficient and will not affect ramp operations.

6.5 Intersection Capacity Analysis

Capacity analyses for the signalized and unsignalized intersections at the study interchanges were performed using TransModeler software for Existing, 2040 No-Build, and 2040 Build RRPA conditions. Preminary interchange alternatives capacity screening analysis was completed and documented in the *Alternatives Traffic Analysis Technical Memo.* Detailed analyses for Exit 106, Exit 108, Exit 110, Exit 63 and Exit 65 under existing conditions (existing traffic, intersection traffic control and geometry) and 2040 No-Build conditions (2040 traffic, and existing interection traffic control and geometry) are summarized in the following sections.

The signalized and unsignalized intersection analyses for Existing and 2040 No-Build conditions were obtained from the TransModeler microsimulation output files, which include an average delay of ten (10) runs. For unsignalized intersections, the intersection operation is represented by the worst approach delay and LOS of all of the STOP-controlled appraches to the intersection. TransModeler measures control delay in accordance with HCM methodology and considers vehicles as soon as they begin to brake to join the back of a queue forming at an intersection until it has passed through the intersection and returned to speed. The comparision results of the capacity analyses for existing conditions and the 2040 No-Build conditions are shown in **Table 6-10** and in **Figure 6-1** through **Figure 6-5**. The TransModeler control delay outputs are provided in **Appendix E**.

Under Existing Conditions:

- At Exit 106 (St. Andrews Road – S-32-36/S-40-42), the study interestions operate at LOS D or better during the morning peak hour and afternoon peak hour.
- At Exit 108 (Bush River Road – S-40-31), the intersection of Bush River Road at I-26 eastbound off-ramp/driveway operates at LOS E during both the morning and afternoon peak hour. All other intersections operate at LOS C or better during both the morning and afternoon peak hours.
- At Exit 110 (US 378 – Sunset Boulevard), the intersection of Sunset Boulevard at the I-26 eastbound off-ramp operates at LOS E and LOS F during the morning and afternoon peak hours, respectively, while the other intersections operate at LOS D or better during the morning and afternoon peak hours.
- At Exit 63 (Bush River Road – S-32-273), the study intersections operate at LOS C or better during the morning and afternoon peak hours.
- At Exit 65 (Broad River Road – US 176), the intersection of Broad River Road at the I-20 westbound ramps operates at LOS F during the afternoon peak hour. All other intersections operate at LOS D or better during the morning and afternoon peak hours.

In general, with forecast increases in traffic and without improvements to the intersections, the delay in the 2040 No-Build analyses can be expected to be higher comparing to the Existing Conditions. Improvements such as additional storage to turning movements and/or signal timing adjustments would be necessary to provide acceptable LOS during the 2040 No-Build operating conditions at these interesections.

For the RRPA, the individual interchanges were modeled using Synchro/SimTraffic to analyze and simulate the arterial and intersection operations and to aid in the development of traffic control and geometric recommendations. As discussed in the *Alternative Traffic Analysis Technical Memo Report*, the arterials coded

into the TransModeler network were verified and adjusted based on existing conditions and collected traffic data. Due to the limitations of Synchro's dynamic assignment of volumes and modeling of static volumes only, intersection capacity analysis for the RRPA was also conducted in the Transmodeler network to account for shifted traffic from existing interchange configurations to 2040 Build interchange configurations. Those analyses will be discussed below.

Table 6-10 - Intersection Capacity Analysis Results - Existing Vs. 2040 No Build

[1] Intersection unsignalized under all scenarios; worst approach LOS and delay reported.

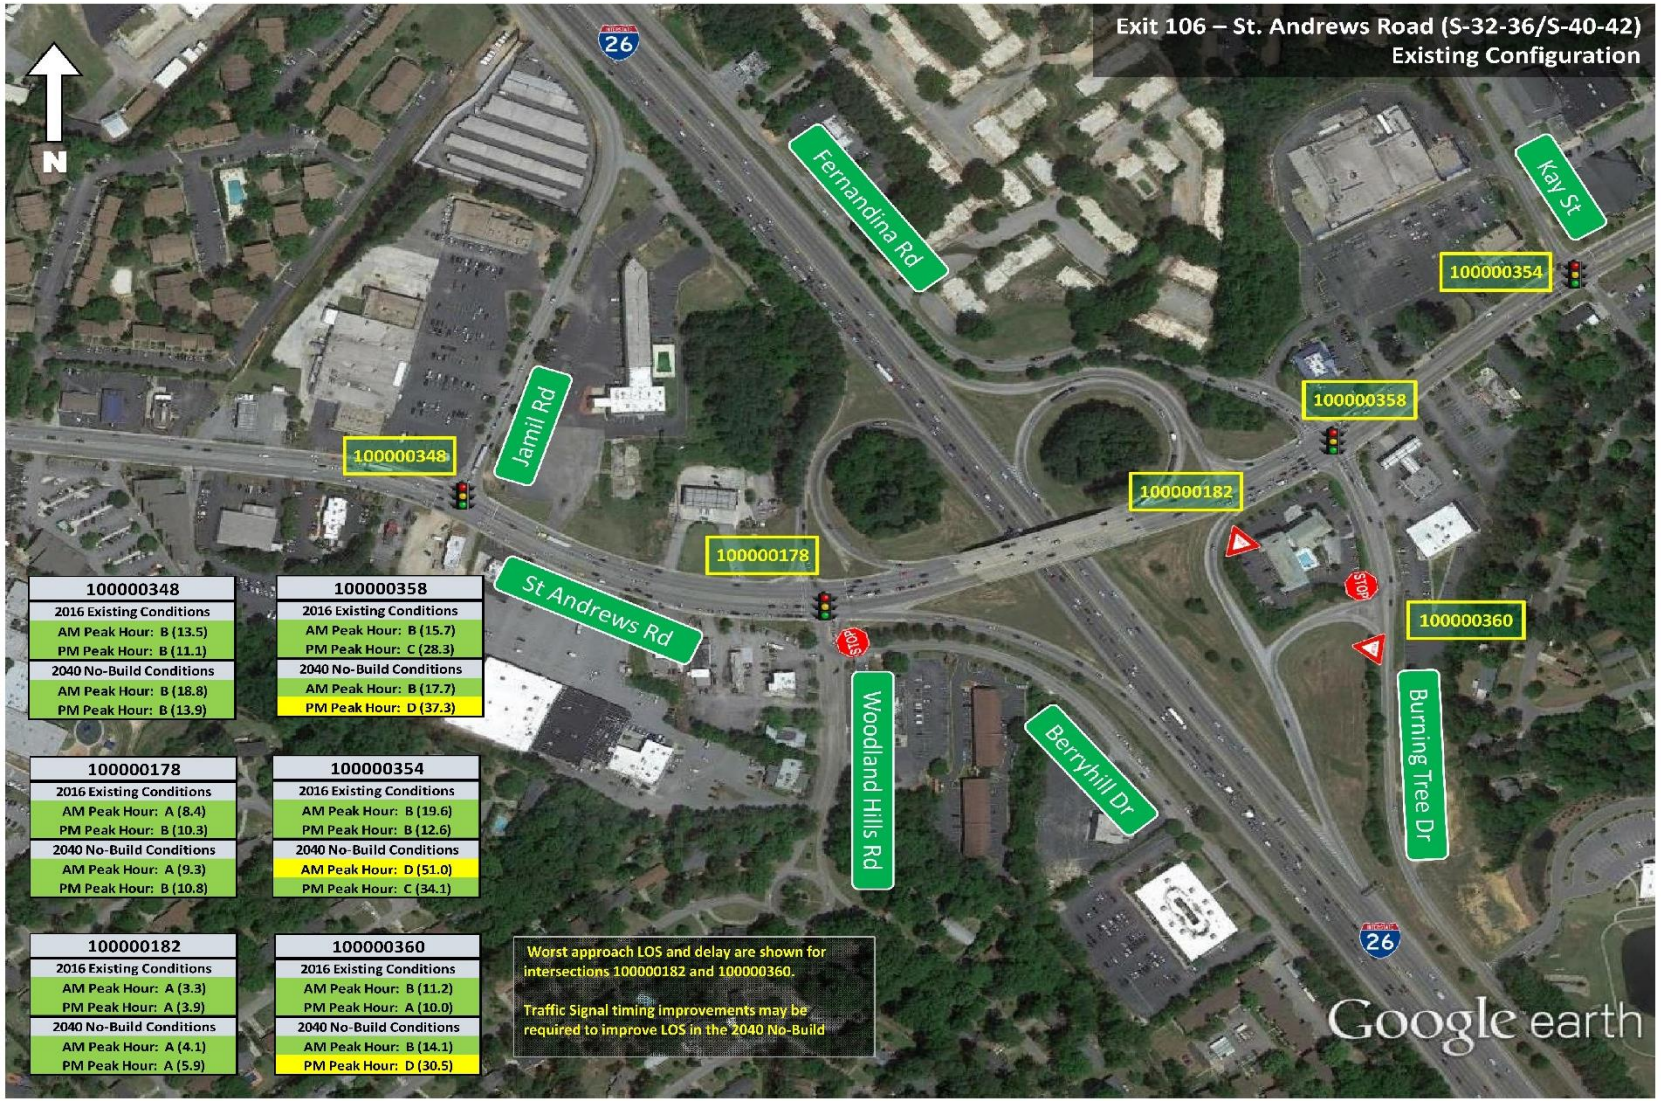

Figure 6-1 - Exit 106 - St. Andrews Road Intersection LOS Summary

Figure 6-2 - Exit 108 - Bush River Road Intersection LOS Summary

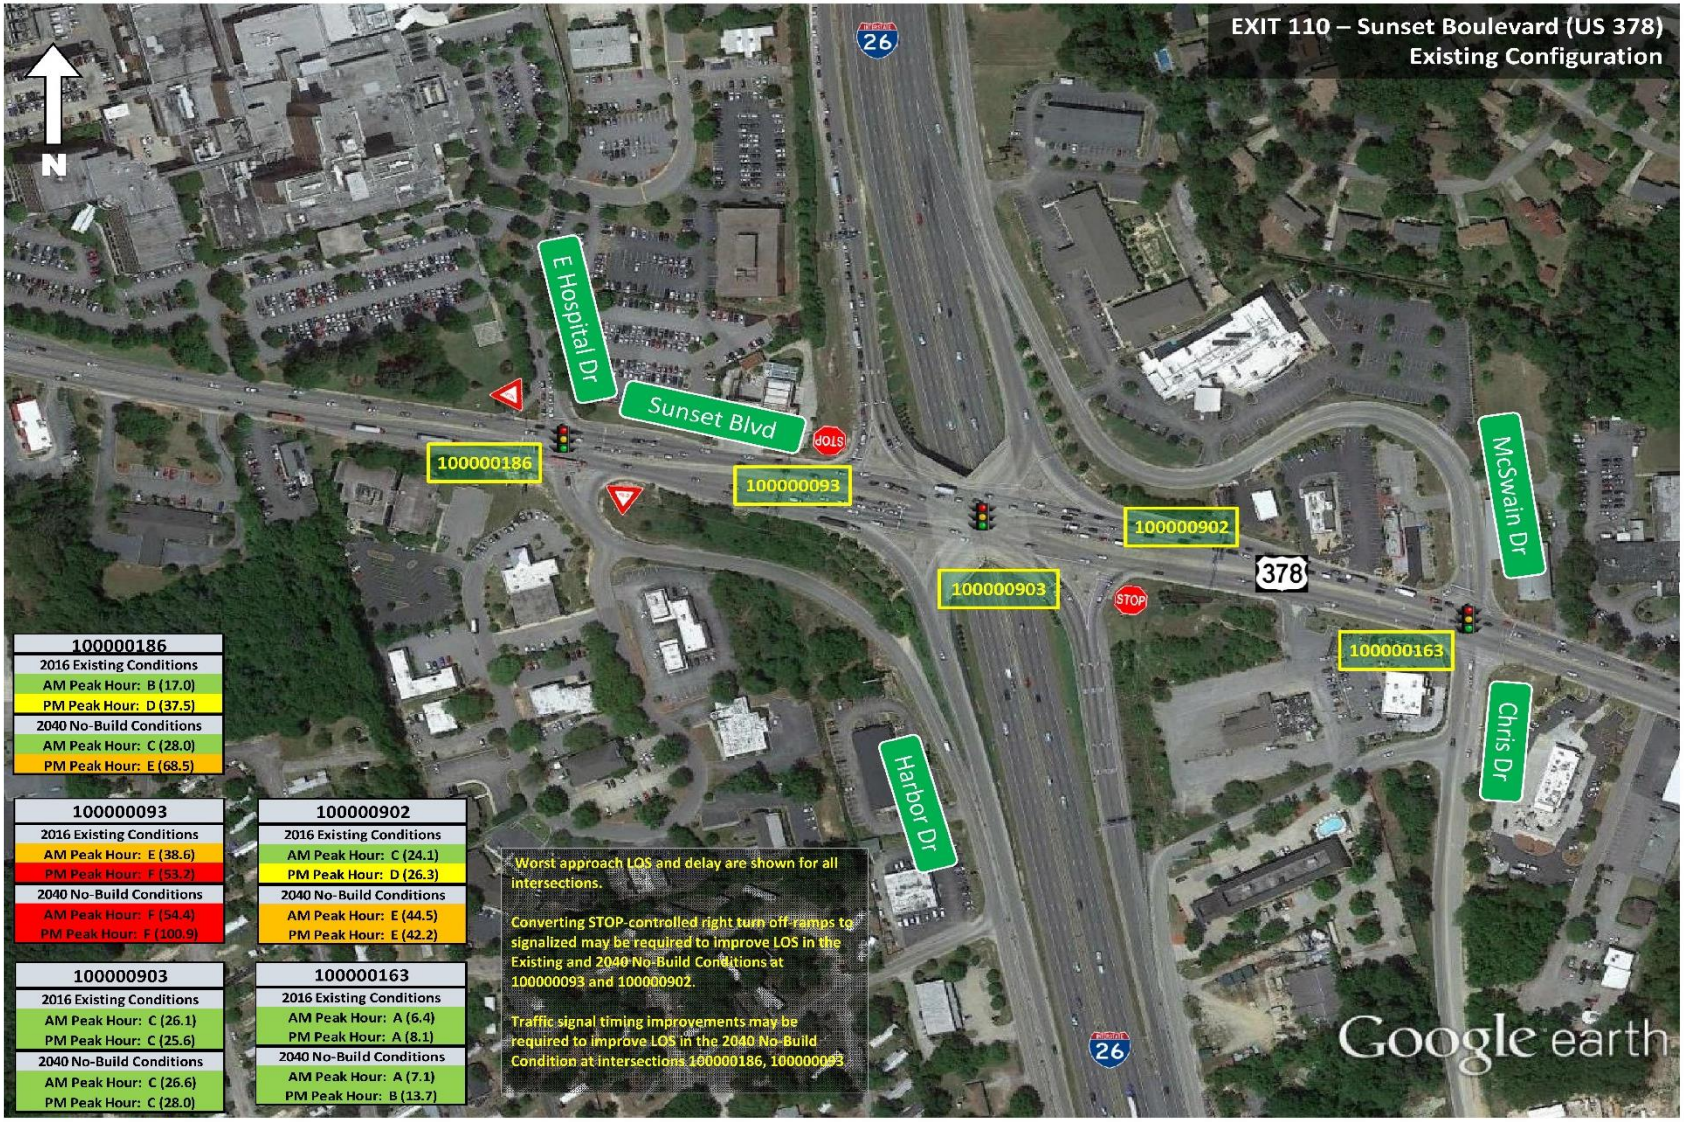

Figure 6-3 - Exit 110 - Sunset Boulevard (US 378) Intersection LOS Summary

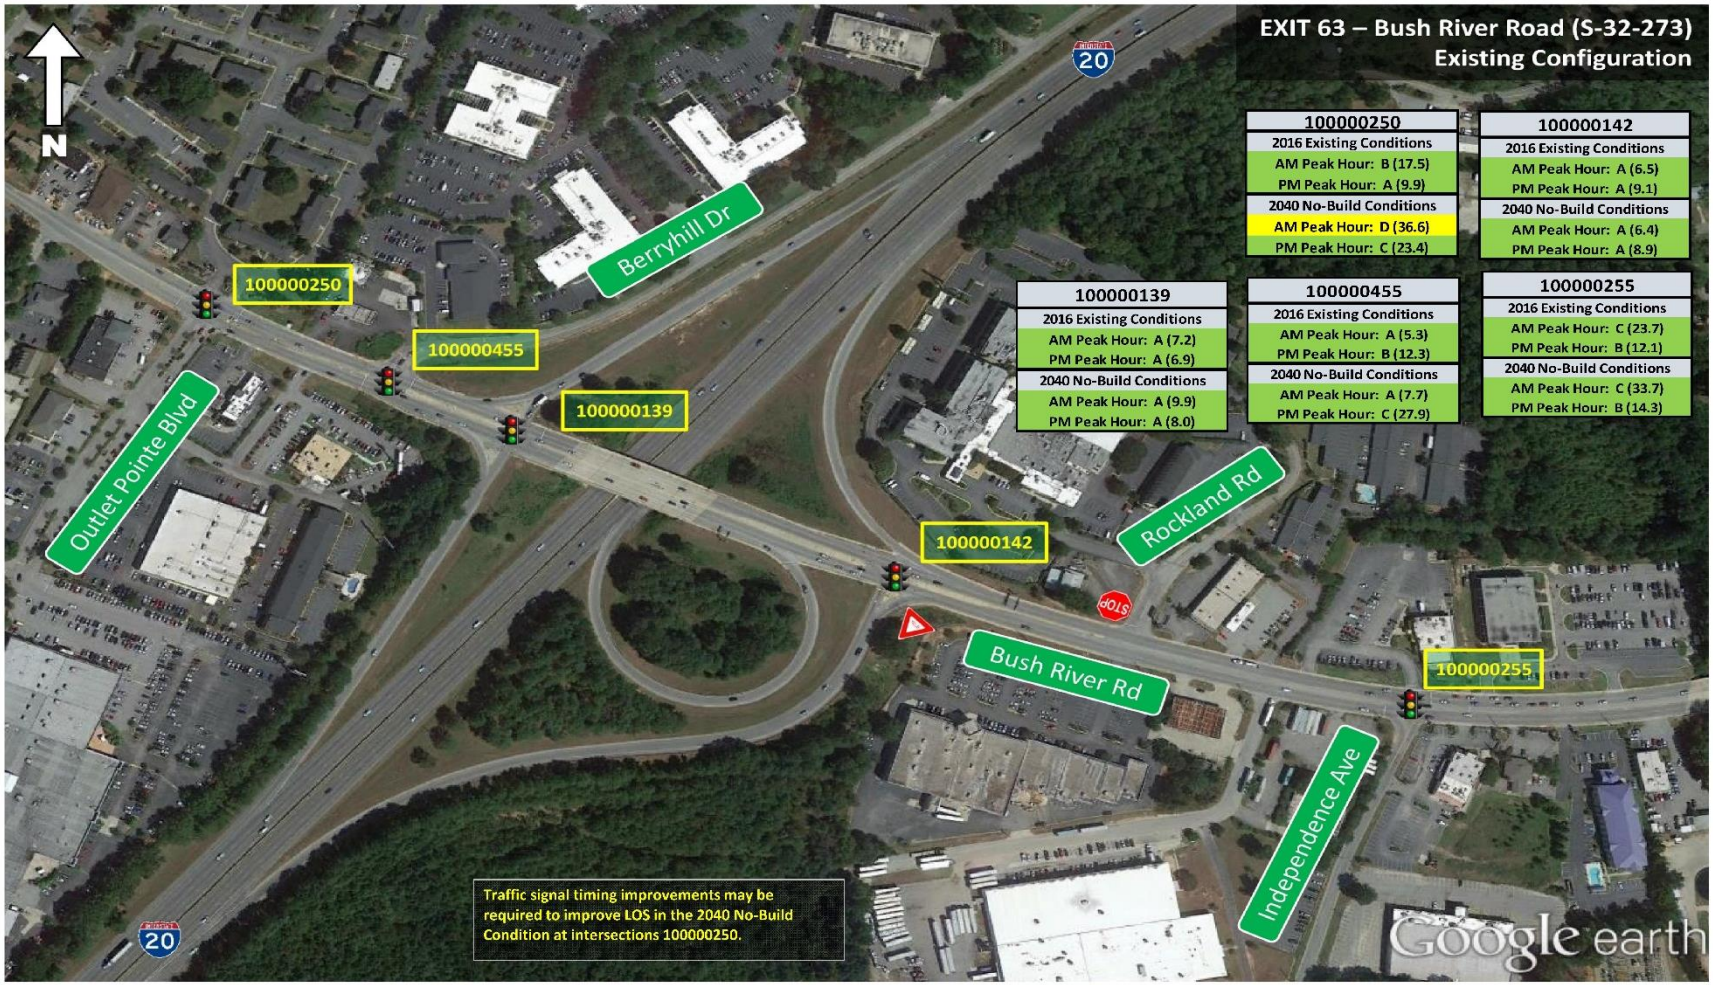

Figure 6-4 - Exit 63 - Bush River Road Intersection LOS Summary

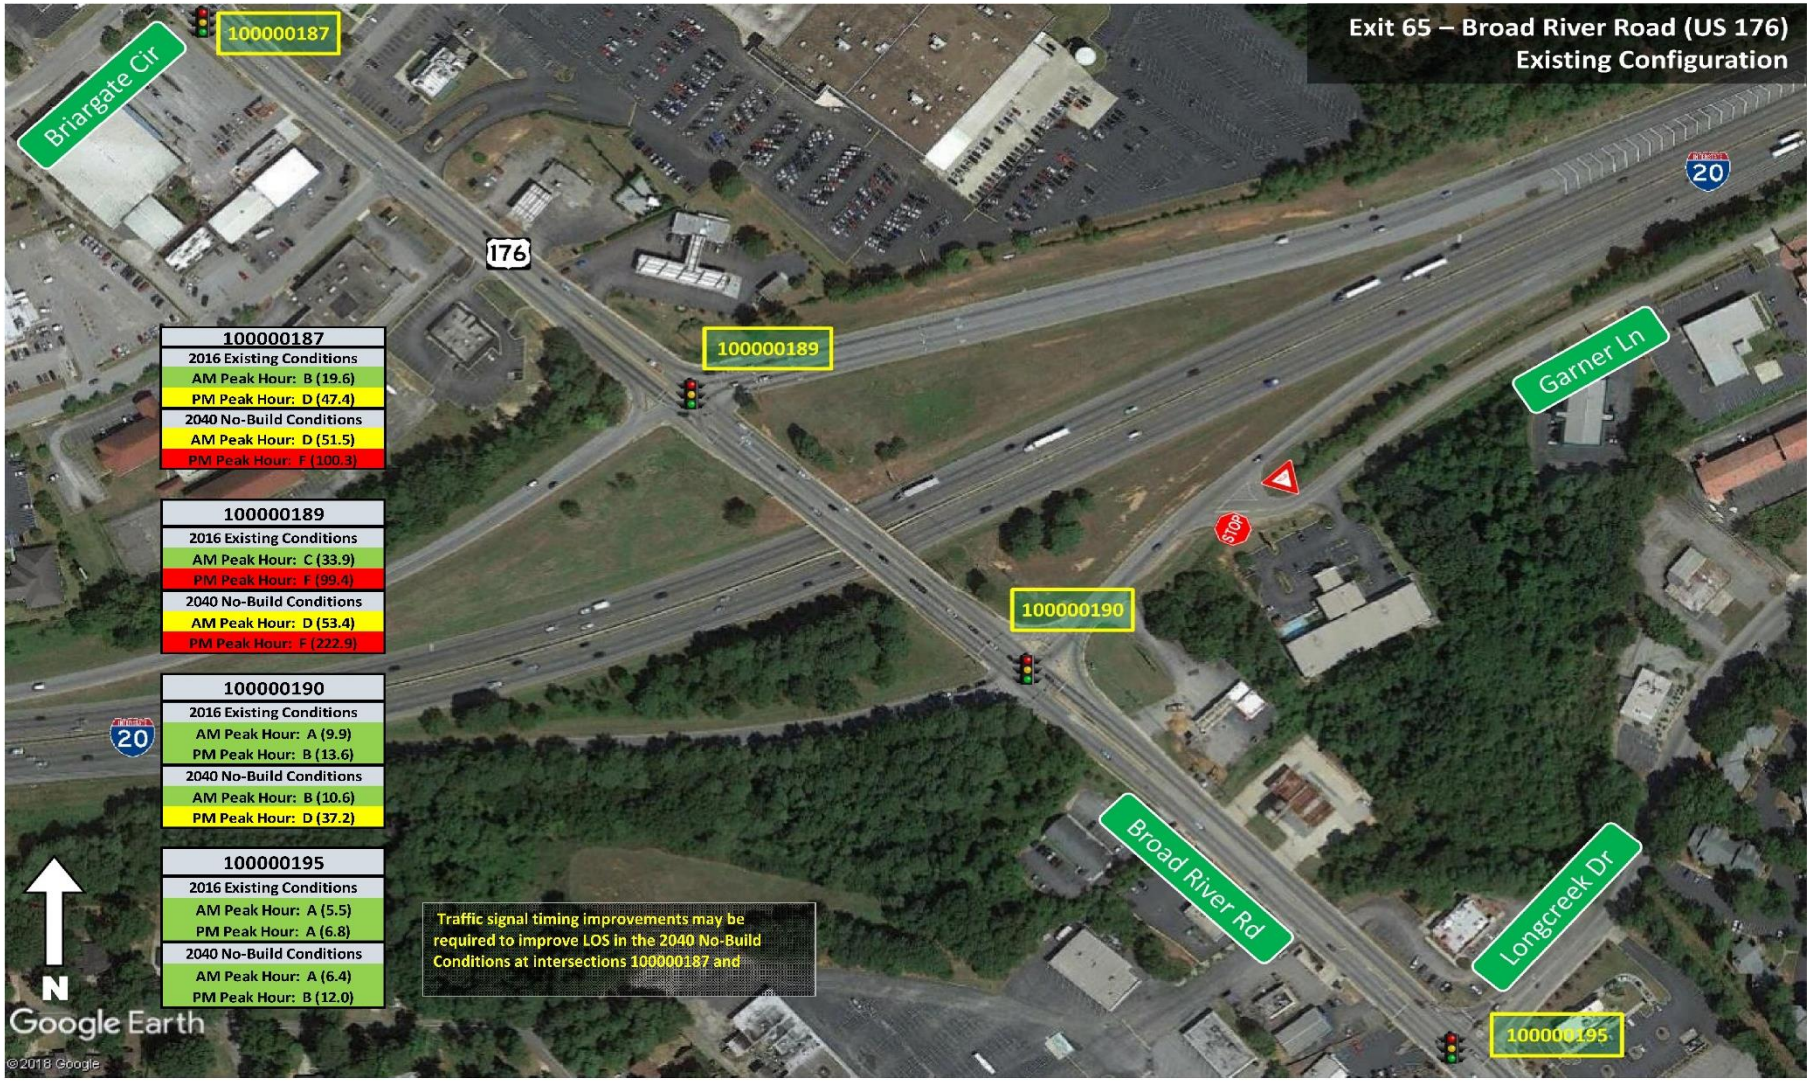

Figure 6-5 - Exit 65 - Broad River Road (US 176) Intersection LOS Summary

The signalized and unsignalized intersection analyses for 2040 Build RRPA conditions were obtained from the TransModeler microsimulation output files, which include an average delay of ten (10) runs. As part of the 2040 Build intersection capacity analysis, queue reports were obtained from the TransModeler output files. TransModeler reports queue lengths in two ways, as lane queues and as spillback queues. Lane queues are measured by lane, but do not measure beyond the upstream superlink approach. However, spillback queues capture the full, dynamic length even if queues branch in different directions. Both lane queues and spillback queues are provided at the ramp terminal intersections and adjacent intersections along the arterials.

Capacity Analysis results at Exit 106, Exit 108, Exit 63, Exit 65, and Colonial Life Blvd for 2040 Build Conditions are summarized in **Table 6-11** and below. **Table 6-12** through **Table 6-16** summarize queue length results for the above interchanges, excluding Exit 108.

Exit 106 – St. Andrews Road

The existing configuration of Exit 106 is expected to be replaced with a Single Point Urban Interchange (SPUI) as part of the RRPA. Other elements of the concept include:

- Converting the I-26 westbound right turn off-ramp to eastbound St Andrews Road from yield-controlled to STOP-controlled.
- Modifying the intersection of St. Andrews Road at Fernandina Road to include northbound dual left turn lanes

The 2040 Build configuration for Exit 106 is depicted in **Figure 6.6**.

Under the 2040 Build conditions, all intersections operate at LOS D or better except the intersection of St. Andrews Road with the I-26 westbound right turn off-ramp to eastbound St Andrews Road, which operate at LOS F during both the morning and afternoon peak hours. This insection has been converted from a yield controlled intersection to STOP-controlled consistent with SCDOT guidelines for the treatment of channelized right turns at ramp termini interesction.

Exit 108 – Bush River Road

The existing configuration of Exit 108 is expected to be modified to remove the interstate access ramps as part of the RRPA. The 2040 Build configuration for Exit 108 is depicted in **Figure 6.7.**

Under the 2040 Build conditions, all intersections operate at LOS D or better.

Exit 110 – Sunset Boulevard

The existing SPUI configuration of Exit 110 is expected to be unchanged. The only modification included in the RRPA is the extension of the I-26 westbound off-ramp. Due to congestion and queuing on the off-ramps that were identified under 2040 No-Build conditions, the right turn movements on the off ramps were converted from STOP-control and incorporated into the SPUI signalization. No geometric modifications to the arterial were proposed.

Under the 2040 Build conditions, all intersections operate at LOS D or better except the intersection of Sunset Boulevard at Chris Drive/McSwain Drive that operates at LOS E.

Exit 63 – Bush River Road

The existing configuration of Exit 63 is expected to be replaced with a Diverging Diamond Interchange (DDI) as part of the RRPA. Other elements of the concept include:

- Removing the intersection of Bush River Road at Berryhill Drive and creating a cul de sac at the end of Berryhill Drive.
- Adding an overpass bridge connection of Berryhill Drive and Rockland Road.
- Installation of a signal at the intersection of Bush River Road and Rockland Road with an exclusive eastbound left turn phase.

The 2040 Build RRPA configuration for Exit 106 is depicted in **Figure 6.8**.

Under the 2040 Build RRPA conditions, all intersections operate at LOS C or better except the intersection of Bush River Road at Outlet Point Boulevard which operates at LOS E.

Exit 65 – Broad River Road

The existing configuration of Exit 65 is expected to be replaced with a Single Point Urban Interchange (SPUI) as part of the RRPA. The 2040 Build configuration for Exit 106 is depicted in **Figure 6.9**.

Under the 2040 Build conditions, all intersections operate at LOS D or better.

Colonial Life Boulevard Interchange

As part of the RRPA, the existing configuration of Colonial Life Boulevard is expected to be replaced with a full access tight urban diamond interchange (TUDI) with braided ramps providing access to/from Colonial Life Boulevard instead of the partial interchange providing access to/from I-126 to the east towards the City of Columbia. Both the eastbound and westbound ramp intersections will be signalized.

The 2040 Build RRPA configuration for Exit 106 is depicted in **Figure 6.10**.

Under the 2040 Build RRPA conditions, both intersections operate at LOS C or better.

7 Interchange Justification

A policy statement for justifying the need for additional or modified access to the existing sections of an Interstate System was first published in the Federal Register on October 22, 1990 entitled "Access to the Interstate System". It was then modified and updated on February 11, 1998, on August 27, 2009, and on May 22, 2017. The objections of this policy are to ensure that all new or revised access points do not adversely impact the operations and safety of the Interstate System, and all new or revised access points have been vetted through a systematic evaluation process.

In order to explain the intent and requirements of this new policy, FHWA published a Memorandum on May 22, 2017. This FHWA Guide was followed in preparing the current Interchange Modification Report (IMR) for the I-20/I-26/I-126 Interchange in Lexington and Richland Counties, South Carolina.

7.1 Policy Point 1

An operational and safety analysis has concluded that the proposed change in access does not have a significant adverse impact on the safety and operation of the Interstate facility (which includes mainline lanes, existing, new, or modified ramps, ramp intersections with crossroad) or on the local street network based on both the current and the planned future traffic projections. The analysis should, particularly in urbanized areas, include at least the first adjacent existing or proposed interchange on either side of the proposed change in access (23 CFR 625.2(a), 655.603(d) and 771.111(f)). The crossroads and the local street network, to at least the first major intersection on either side of the proposed change in access, should be included in this analysis to the extent necessary to fully evaluate the safety and operational impacts that the proposed change in access and other transportation improvements may have on the local street network (23 CFR 625.2(a) and 655.603(d)). Requests for a proposed change in access should include a description and assessment of the impacts and ability of the proposed changes to safely and efficiently collect, distribute, and accommodate traffic on the Interstate facility, ramps, intersection of ramps with crossroad, and local street network (23 CFR 625.2(a) and 655.603(d)). Each request should also include a conceptual plan of the type and location of the signs proposed to support each design alternative (23 U.S.C. 109(d) and 23 CFR 655.603(d)).

The intent of Policy Point 1 is to require detailed operational and safety analysis of the relevent interstate segments and provide a comparison of the no-build and build conditions that are anticipated to occur through the design year of the project.

The analysis of the I-20, I-26, and I-126 interstate facilities, the I-20/I-26 system interchange (Exit 64/Exit 107), the I-26/I-126 system interchange (Exit 108), and the adjacent and closely interconnected interchanges at I-20 Exits 63 and 65, I-26 Exit 106, and the I-126 interchange at Coloinal Life Boulevard is an extension of the previous project wide traffic operations and safety analyses as summarized in the *Alternatives Traffic Analysis: Carolina Crossroads I-20/I-26/I-126 Corridor Project, Crash Analysis: Carolina Crossroads I-20/I-26/I-126 Corridor Project*.

The analysis of the interstate facilities includes the portion of I-20 between the crossings of the Saluda River and Broad River, the portion of I-26 between Exit 103 (Piney Grove Road) and Exit 110 (US 378), and the portion of I-

126 between I-26 and the interchange at Greystone Boulevard, and includes the proposed modification of the system interchanges of I-20/I-26 (Exit 64/Exit 107) and of I-26/I-126 (Exit 108), and the services interchanges at Exit 106 (St Andrews Road), Exit 63 (Bush River Road), Exit 64 (Broad River Road) and Colonial Life Boulevard. The analysis was performed using methodologies and procedures outlined in the Transportation Research Board's *Highway Capacity Manual* and used the TransModeler micro-simulation modeling software.

The Refined Recommended Preferred Alternative (RRPA) replaces the existing full cloverleaf I-20/I-26 system interchange with a directional turbine interchange, eliminating the four short congested weaving sections between the heavily traveled loop ramps. The RRPA also revises the I-26/I-126 system interchange to provide improved continuity for traffic traveling on I-26. The proposed collector-distributor system relocates from the mainline facilities the many complex, multi-lane weaving areas and the merge and diverge movements to and from the adjacent service interchanges at Exit 106, Exit 63, and Exit 65. The collector distributor road system eliminates multiple existing conflict points with mainline traffic, improving safety and operations on the interstate routes.

The analysis of the 2040 Build condition of the RRPA illustrates that the project would not have any significant negative impact on the safety and the operation of the facilities within the project area. The increased capacity provided by the RRPA will result in generally comparable LOS in the morning and afternoon peak hours compared to the Existing Conditions, and improved LOS over the 2040 No-Build conditions.

Exit 106 (St Andrews Road), the interchange adjacent to, and to the north of, the I-20/I-26 system interchange, is proposed to be modified to provide a Single Point Urban Interchange. Exit 104 (Piney Grove Road), the next adjacent interchange to the west of Exit 106, is not expected to be modified as part of this project. Exit 104 is located approximately two miles west of the Exit 106 interchange. There are no anticipated operations concerns related to the spacing between the two interchanges. Sufficient distance exists between upstream and downstream merging/diverging areas at the adjacent interchanges to eliminate the influence of traffic movements within these areas. The analysis shows the eastbound freeway segments are projected to operate at LOS D and LOS C in the during the morning and afternoon peak hours, respectively. In the westbound direction, the freeway segment is expected to operate at LOS D and LOS F during the morning and afternoon peak hours, respectively. However, the density of these segments in the RRPA are generally better than the density of the same segments under existing conditions.

Exit 110 (US 378), the interchange adjacent to, and to the south of, the I-26/I-126 system interchange, is not proposed to be modified from its existing Single Point Urban Interchange configuration. However, due to extensive recurring queuing on the westbound off-ramp, the deceleration lane is proposed to be extended by approximately 2,500 feet as part of this project. The spacing between the relocated diverge area and merge area (from the I-126 westbound fly-over ramp) has been shortened to about 2,500 feet which is sufficient and will not adversely affect mainline and ramp operations. All freeway, merge and diverge areas in the eastbound direction between the I-126 westbound fly-over on ramp and the Exit 110 off-ramp operate at LOS D or better during both the morning and afternoon peak hours.

Exit 63 (Bush River Road), the interchange adjacent to, and to the west of, the I-20/I-26 system interchange, is proposed to be modified to provide a Diverging Diamond Interchange. Exit 61 (US 1), the next adjacent interchange to the west of Exit 63, is not expected to be modified as part of this project. Exit 61 is located approximately 2.1 miles west of Exit 63 and is west of the Saluda River crossing that makes up the western Carolina Crossroads study area limits on I-20. There is a potential project outside of the Carolina Crossroads improvements that may extend the deceleration lane for the westbound off-ramp to Exit 61. The Exit 61 westbound off-ramp, outside of the project limits, may substantially affect the westbound mainline density and Exit 63 westbound merge operations due to high ramp volumes and congestion identified along the Exit 61 arterial.

Exit 65 (Broad River Road), the interchange adjacent to, and to the east of, the I-20/I-26 system interchange is proposed to be modified to provide a Single Point Urban Interchange. Exit 68 (Monticello Road), the next adjacent interchange to the east of Exit 65, is not expected to be modified as part of the project. Exit 68 is located approximately 3.2 miles east of Exit 65 and is east of the Broad River crossing that makes up the eastern Carolina Crossroads study area limits on I-20. Because of the distance between Exits 65 and 68, and the bridge crossing the Broad River creating a barrier, and that the widening of I-20 ends east of the Broad River crossing, FHWA and SCDOT agreed that the Exit 68 interchange would not influence operations at Exit 65. However, with increased volumes and improved throughput within the system-to-system interchange, heavy queuing and ramp backup along I-20 eastbound was identified, due to the mainline capacity constraint that occurs at the eastern project limits as the proposed four lane section transitions into the existing three lane section at the bridge across Broad River just east of Exit 65.

The Colonial Life Boulevard interchange on I-126 is the interchange adjacent to, and to the south of the I-26/I-126 interchange. This interchange is proposed to be modified from the eastern-oriented partial interchange to a full access interchange. The interchange at Greystone Boulevard is the next adjacent interchange and is located about one mile east of the Colonial Life Boulevard interchange. Sufficient distance will be provided between the upstream and downstream merging/diverging areas at the adjacent interchanges to eliminate the influence of traffic movement within these areas.

The *Crash Analysis: Carolina Crossroads I-20/I-26/I-126 Corridor Project* identified a total of 3,351 crashes occurring between January 1, 2012 and December 31, 2014 along the three interstate routes within the study area.

I-26 experienced the most crashes within the study area. A total of 2,370 crashes occurred along I-26. There were 796 crashes along I-20. I-126 experienced the fewest crashes, with 185 crashes. Along I-20 and I-26, rear end collisions (about 62 percent) were most frequent, followed by same direction sideswipe accidents (approximately 18 percent) and no collision with motor vehicle (approximately 17 percent). Rear end collisions were also the most frequent type of collision (approximately 44 percent) along I-126. However, the no collision with motor vehicle crashes on I-126 were about double (approximately 31 percent) the percentage of similar type collisions reported on I-26 (about 17 percent) and I-20 (about 14 percent).

There were 609 crashes resulting in injury (about 18 percent). Twelve crashes resulted in fatalities. Of the 12 fatal crashes along the interstate routes within the study area, seven took place along I-26, three on I-20, and two on I-126.

The recurring congestion, the close spacing of the service interchanges adjacent to the I-20/I-26 and I-26/I-126 system interchanges, and the multiple complex weaving movements within and adjacent to the system interchanges contribute to the frequency of crashes within the study area. The proposed interchange improvements at the system interchanges and the addition of the collector-distributor road systems along I-20 and I-26 should improve safety and improve traffic operations by removing the numerous existing vehicle conflict points and relocating merge/diverge areas and weaving sections within the study area from the mainline lanes to the collector-distributor lanes. By removing the Bush River Road ramps at Exit 108, the short weaving section between the ramp from eastbound I-20 to eastbound I-26 and the eastbound off-ramp to Exit 108 is eliminated. The congestion caused by the complex westbound weaving movements to travel to I-20 and to Exit 106 after I-126 merges with I-126 is also eliminated.

Pedestrian facilities will be incorporated into the proposed service interchanges at Exits 106, 63 and 65.

A conceptual signing plan for the RRPA is provided in **Appendix F**.

7.2 Policy Point 2

The proposed access connects to a public road only and will provide for all traffic movements. Less than "full interchanges" may be considered on a case-by-case basis for applications requiring special access, such as managed lanes (e.g., transit, HOVs, HOT lanes) or park and ride lots. The proposed access will be designed to meet or exceed current standards (23 CFR 625.2(a), 625.4(a)(2), and 655.603(d)). In rare instances where all basic movements are not provided by the proposed design, the report should include a full-interchange option with a comparison of the operational and safety analyses to the partial-interchange option. The report should also include the mitigation proposed to compensate for the missing movements, including wayfinding signage, impacts on local intersections, mitigation of driver expectation leading to wrong-way movements on ramps, etc. The report should describe whether future provision of a full interchange is precluded by the proposed design.

The intent of Policy Point 2 is to require implementation of interchange design for interstate acces that allows for all relevant movements for general purpose traffic, whenever feasible.

The existing system interchanges at I-20/I-26 (Exit 64/Exit 107) and at I-26/I-126 (Exit 108) provide for all traffic movements between the respective interstate routes. The proposed modificaitons of the system interchanges will continue to provide for all traffic movements between the interstate routes.

The existing service interchanges at Exit 106, Exit 63, and Exit 65 currently provide full access for all traffic movements. As illustrated by the design concepts for these interchanges, the proposed modifications to Exits 106, 63, and 65 will continue to provide full access for all traffic movements.

The existing configuration of the Exit 106 westbound off-ramp will be continued in the proposed interchange configuration. The proximity along St Andrews Road of the westbound off-ramp intersection and the Fernandina Road/Burning Tree Road frontage road intersection makes it desireable to maintain the connection from the off-ramp to Burning Tree Road and a separate connection to eastbound St Andrews Road. The ramp connecting to Burning Tree Road will continue to provide access to the south on Burning Tree Road, and to encourage safer access to northbound Fernandina Road.

SIGNAL WARRANT ANALYSIS

Bower Pkwy AT Park Terrace Dr Date: 11/21/2016

Minor Street Volume, percent of total = 26.6%
Percent of Left Turns from Minor Street = 52.9%
Percent of Right Turns from Minor Street = 43.6%
Percent of Minor Street Right Turns to Remove from Warrant Analysis = 0%
WARRANT BASIS = **100%**

Warrant No. 1 - Vehicular Volume is met

Condition A - Minimum Vehicular Volume is met

Average Major Street % of Warrant	Average Minor Street % of Warrant
843.0 / 500 = 169%	292.6 / 150 = 195%

Hourly percent of warrant

	7:00 - 8:00	8:00 - 9:00	9:00 - 10:00	10:00 - 11:00	11:00 - 12:00	12:00 - 13:00	13:00 - 14:00	14:00 - 15:00	15:00 - 16:00	16:00 - 17:00	17:00 - 18:00	18:00 - 19:00
Major St.	64%	76%	116%	147%	188%	245%	216%	225%	182%	184%	205%	175%
Minor St.	86%	107%	95%	151%	222%	291%	277%	268%	220%	167%	240%	217%

Condition B - Interruption to Continuous Traffic is met

Average Major Street % of Warrant	Average Minor Street % of Warrant
843.0 / 750 = 112%	292.6 / 75 = 390%

Hourly percent of warrant

	7:00 - 8:00	8:00 - 9:00	9:00 - 10:00	10:00 - 11:00	11:00 - 12:00	12:00 - 13:00	13:00 - 14:00	14:00 - 15:00	15:00 - 16:00	16:00 - 17:00	17:00 - 18:00	18:00 - 19:00
Major St.	43%	51%	77%	98%	126%	163%	144%	150%	121%	123%	136%	117%
Minor St.	172%	215%	189%	301%	444%	583%	553%	536%	440%	333%	480%	435%

80% Combination of Conditions A & B is met

Warrant No. 2 - Four Hour Vehicular Volume is met

Hourly percent of warrant

	7:00 - 8:00	8:00 - 9:00	9:00 - 10:00	10:00 - 11:00	11:00 - 12:00	12:00 - 13:00	13:00 - 14:00	14:00 - 15:00	15:00 - 16:00	16:00 - 17:00	17:00 - 18:00	18:00 - 19:00
Minor St.	37%	51%	63%	133%	299%	546%	496%	524%	277%	214%	382%	255%

Warrant No. 3 - Peak Hour is met

Percent of warrant		Percent of warrant	
Overall Peak Hour: 12:15 - 13:15		Higher Volume Side Street Peak Hour: 12:30 - 13:30	
Minor St.	320%	Minor St.	302%

Warrant No. 4 - Pedestrian Volume. Pedestrian volume shown are minumum volumes assuming heavy major street traffic. If these volumes are met, warrant 4 requires further engineering analysis

Minimum 4 hour ped. volume crossing major street: 107

Minimum peak hour ped. volume crossing major street: 133

Number of pedestrians crossing major street

	7:00 - 8:00	8:00 - 9:00	9:00 - 10:00	10:00 - 11:00	11:00 - 12:00	12:00 - 13:00	13:00 - 14:00	14:00 - 15:00	15:00 - 16:00	16:00 - 17:00	17:00 - 18:00	18:00 - 19:00
Major St.	0	0	0	0	0	0	0	0	0	0	0	0

Warrant No. 7 - Crash Experience (Requires 3 criteria analysis by engineering)

Total Number: 0 From: 1/1/2005 to 1/1/2008
Accident Rate: 0.00 per million entering vehicles

Types of Accidents	No.	/	Avg.		No.	/	Avg.
Right Angle	0	/	0.0	Rear End	0	/	0.0
Lost Control	0	/	0.0	Side Swipe	0	/	0.0
Left Turn	0	/	0.0	Other	0	/	0.0

1 Introduction

The original I-20/I-26/I-126 System Interchange Modification Report (the System IMR), dated May 2019, presented the anticipated interchange modifications as depicted in the Final Environmental Impact Statement (FEIS) for the project. Since the approval of the System IMR, the Carolina Crossroads I-20/I-26/I-126 Corridor Improvement Project (Carolina Crossroads Program) has been separated into five construction phases. The first three phases of the Carolina Crossroads Program comprise most of the work documented in the System IMR. Improvements to the I-126 at Colonial Life Boulevard interchange are now part of Phase 1 of the Carolina Crossroads Project Delivery while the I-20 Exit 65 Interchange at Broad River Road is now part of Phase 2. Phases 1 and 2 are both underway as design-build projects and the design has been substantially completed. The improvements to I-20/I-26/I-126 system interchanges, along with I-20 Exit 63 (Bush River Road) and I-26 Exit 106 (St. Andrews Road) are now part of Phase 3, which will also be a design-build project. Traffic Technical Memoranda addressing changes to the I-126 Colonial Life Boulevard interchange and I-20 Exit 65 (Broad River Road) were submitted as part of the Phase 1 and Phase 2 design-build projects, ID P039718 and ID P039719, respectively.

As the evolution of the Carolina Crossroads Program through the phased construction delivery is discussed, it is important to understand the key terms that define various milestones in the evolution of the design as it relates to the FEIS and the Record of Decision (ROD) for the Carolina Crossroads Program and the System IMR. The design concept depicted in the FEIS was referred to as the **Refined Recommended Preferred Alternative (RRPA)**, which as the name implies was a refinement to the Recommended Preferred Alternative (RPA) presented the in the Draft EIS. Since the System IMR was developed in parallel with the EIS documents, the nomenclature associated with the design concept in the documents was consistent and therefore the System IMR refers to the design concept used in the "Build" analysis as the RRPA. Once the ROD was issued in May of 2019, the RRPA concept became known as the **Selected Alternative (SA)**; however, many of the reference documents to the FEIS/ROD were not updated to reflect this change in nomenclature, including the System IMR. *Therefore, the terms RRPA and SA are synonymous.*

As the Carolina Crossroads Program has advanced through the initial construction phases and right-of-way acquisition, the design concept has been updated periodically. These updates include changes to the design associated with the final design that have been developed during Phases 1 and 2 and changes made to the design concept outside of Phases 1 and 2 based on refinements made during right-of-way acquisition throughout the entire limits of the Carolina Crossroads Program. The version of the design concept that includes all of these changes is referred to as the **Modified Selected Alternative (MSA)**. The MSA is fluid and will continue to evolve as the Carolina Crossroads Program is constructed.

In advance of the procurement of Phase 3, this report provides a summary of the updated MSA network analyses which now includes the final design concepts for Phase 1 and Phase 2 as well as an updated interchange concept at I-20 Exit 63 (Tie-in). These three changes are described below and constitute the major changes from the RRPA/SA as it relates to effects on the System IMR. The results from the MSA network analyses are compared to the original RRPA/SA results that were included in the approved IMR in order to demonstrate that performance within the network is improved or essentially unchanged relative to the Measures of Effectiveness (MOE) presented in the approved System IMR.

2 Background

As part of the Phase 1 construction, the existing configuration of the Colonial Life Boulevard interchange at I-126 was originally expected to be replaced with a full access tight urban diamond interchange under the approved Selected Alternative (SA) network. Due to factors such as design innovation, construability, cost effectiveness, and traffic operations, a partial diverging diamond interchange concept, as shown in **Figure 1**, was chosen. This design incorporates a new single crossover intersection rather than two signalized intersections as part of the SA. The full traffic analysis including the interchange justification for this preferred alternative can be found in the September 2021 *Technical Memorandum I-126 at Colonial Life Boulevard Interchange – Traffic Analysis* prepared by Ramey Kemp Associates.

As part of the Phase 2 construction, the existing configuration of the Exit 65 Broad River Road (US 176) at I-20 was originally expected to be replaced with a single point urban interchange (SPUI) under the approved SA network. Due to factors such as design innovation, constructability, cost effectiveness, and traffic operations, an offset diverging diamond interchange concept, as shown in **Figure 2**, was chosen. This design incorporates two new crossover intersections rather than signal point intersection as part of the SA. The full traffic analysis including the interchange justification for this preferred alternative can be found in the March 2022 *Technical Memorandum I-20 at Broad River Road Interchange – Traffic Analysis* prepared by Ramey Kemp Associates.

Due to design constraints, including right of way impacts, additional alternatives have been analyzed under 2040 conditions at the I-20 Exit 63 Interchange including a Displaced Single Point Urban Interchange (DSPUI), Partial Cloverleaf Interchange (ParClo) and a modified Existing Tie-In Interchange (Tie-in). The modified existing tie-in interchange, as shown in **Figure 3** was chosen to replace the proposed Diverging Diamond Interchange (DDI) that incorporated an overpass bridge connection of Berryhill Road and Rockland Road under the a[NPMRDS]cted Alternative (SA) network.

Under the Tie-In concept, the existing eastbound off-ramp location is maintained but widened to two lanes shortly after the ramp exit from the C-D road, then expanded to three lanes with dual right turns operating under signalized conditions. The I-20 westbound off-ramp is shifted closer to the mainline and expanded to three lanes at the ramp-terminus including a left turn lane, shared left-right turn lane, and right turn lane. The I-20 westbound ramps no longer operate under one traffic signal controller with the adjacent intersection at Berryhill Road. Based on the preliminary analysis and heavy queuing observed in the simulations, the I-20 westbound on-ramp has been modified to provide two lanes to accommodate traffic from the dual westbound left turn lanes from Bush River Road. The Exit 63 (Tie-in) interchange concept was analyzed initially using a modified version of the SA TransModeler. All other network improvements within the SA network were maintained. Subsequently, the Exit 63 Tie-in concept was incorporated into the MSA network update along with the Phase 1 and Phase 2 interchange updates at I-126 at Colonial Life Boulevard and at I-20 at Broad River Road, respectively.

3 Traffic Analysis

Due to substantial updates to the 2040 SA network, a simulation-based, dynamic traffic assignment (DTA) was completed for the 2040 AM and PM scenarios. The analysis results of the mainline density segments for the 2040 SA (referred to the 2040 Build RRPA as part of the approved IMR) and the 2040 MSA conditions were compared and summarized. **Table 1** through **Table 9** summarize the analysis results for the basic freeway segments, merge segments, and diverge segments, respectively. Density outputs are provided in **Appendix A**.

The 2040 MSA condition LOS, when compared to the 2040 RRPA condition LOS, were the same except for the following:

- During the morning peak hour:
  - The I-26 eastbound merge segment LOS at Exit 104 (Piney Grove Road) declines from LOS C to LOS D
    - Density increases by 2.3 PCE per mile per lane (from 27.9 to 30.2 – the density threshold between LOS C and LOS D is 28.0 PCE per mile per lane).
  - The I-26 westbound merge segment LOS at Exit 106 (St Andrews Road) declines from LOS C to LOS D
    - Density increases by 1.0 PCE per mile per lane (from 27.9 to 28.9 – the density threshold between LOS C and LOS D is 28.0 PCE per mile per lane)
- During the afternoon peak hour:
  - The I-20 westbound segment between Exit 63 (Bush River Road) and Exit 61 (US 378) density improves from 127.7 to 68.9 PCE per mile per lane, although the segment LOS remains at LOS F.
  - The I-20 eastbound merge segment LOS at Exit 65 (Broad River Road) declines from a LOS D to LOS E
    - Density increases by 3.6 PCE per mile per lane (from 34.2 to 37.8 – the density threshold between LOS D and LOS E is 35.0 PCE mile per lane)
  - The I-20 westbound merge segments LOS at the CD road and Exit 63 (Bush River Road) improve from LOS F
    - At the CD Road, density improves from 92.0 PCE per mile per lane (LOS F) to 19.5 (LOS B)
    - At Exit 63 (Bush River Road), density improves from 119.6 PCE per mile per lane (LOS F) to LOS 32.2 (LOS D).
  - The I-20 westbound diverge segment LOS at Exit 65 (Broad River Road) improves from LOS F (44.7) to LOS E (40.4).
  - The I-20 westbound diverge segment at Exit 61 (US 378) density improves from 124.7 to 93.4 although the LOS remains at LOS F.

The reported density improvements around the westbound Exit 63 (Bush River Road) segments may be attributed to the redistribution of the I-20 westbound volume due to the updated dynamic traffic assignment runs completed. Although segment LOS continue to report a LOS F for freeway and diverge segments, the merge segments (CD Road and Exit 63) LOS report improved operations. In general, densities associated with the LOS changes above were noted to be relatively small and do not impact

overall operation of the interchanges and closely match those from the traffic technical memorandums submitted as part of Phase 1 and Phase 2 analyses.

The results of the arterial intersection capacity analysis for 2040 RRPA and the 2040 MSA are compared in **Table 10**.

Under the 2040 MSA conditions, all intersections operate at LOS C or better during both the morning and afternoon peak hours for the Phase 1 Colonial Life Boulevard and the Phase 2 Exit 65 (Broad River Road) interchanges comparable to the 2040 RRPA. The Exit 63 existing tie-in concept intersections operate at LOS D or better except the intersection of Bush River Road at Outlet Point Boulevard which operates at LOS E during the AM peak hour, similar to 2040 RRPA conditions. TransModeler intersection control delay outputs are provided in **Appendix B**.

Figure 4 and **Figure 6** depict the TransModeler screenshots of morning and afternoon peak hour queuing and intersection operations under the Exit 63 Tie-In conditions from the additional alternative analysis, respectively. During the morning peak hour, there is a heavy queue present along the eastbound approach at the intersection of Bush River Road at Outlet Point Boulevard and moderate queue along the I-20 westbound off-ramp. During the afternoon peak hour, there is moderate queue present along westbound Bush River Road, specifically the westbound left turn lanes at the intersection of Bush River Road and the I-20 WB ramps. In addition, there is moderate queue present on the I-20 westbound off-ramp.
